

**QUANTIFYING THE FUTURE**

## The Use of Function Points in Earned Value Management for Software Development

***Cobec Consulting***

***Mike Thompson, Director***

***Dan French, Senior Consultant***

***Ben Netherland***

# Background

- An on-going DOT software program was perceived to be behind schedule, over-budget, and high-risk
  - Program Management had low confidence in the development team's cost/schedule estimates
  - The Development team was being held to an early ROM estimate and the program office was suspicious of the numerous assumptions and qualifiers
  - A realistic, defensible, and repeatable way of reporting software development status was needed to assuage both parties fears

# Proposed Solution Requirements

- The EVM solution should utilize an objective software size reporting metric
- Should leverage available data so reporting can start quickly
- Reporting must be easily understood by all levels of management and provide an accurate gauge of program progress
- Produce performance metrics that can be used with the existing EVM tool

# The Solution

An International Function Point User Group  
(IFPUG) Function Point based EVM reporting  
solution

# Function Point Background

- Developed by Allan Albrecht of IBM in 1979
- Created as an alternative to Source Lines of Code (SLOC) for measuring software size
- Counting Rules are established by the International Function Point Users Group (IFPUG)
- Current version is 4.3.1, Released in January 2010
- International Standards Organization (ISO) Standard for software functional sizing (ISO/IEC 20926 SOFTWARE ENGINEERING - FUNCTION POINT COUNTING PRACTICES MANUAL)

# What are Function Points?

- Function Points are a unit of software size measure
- Measure the work product of software development
- Work product is measured in terms of functionality from user perspective
- Functions points do not measure internal architecture, effort, or technological complexity of an application

# FP EVM Advantages

- When a customer purchases a software development product, they are purchasing functionality, not “Lines of Code.”
- Able to establish and measure progress well in advance of full EVMS planning and implementation
- Function Points will not ebb and flow, as SLOC does – functionality earned will continue to increase with time
- Can implement without large investment in EVM processes, tools or personnel

# Caveats & Constraints

- Relies upon status being reported by the developer, which can be subjective, and can only be verified by the completion of milestones
  - While providing progress status, the method becomes a modified “Milestone Complete” EVM method, which can be translated into percent complete and entered into an EVM tool
- Does not measure software quality
- System Engineering activities are not in scope

# Implementation Background

- Our metrics team met with the program office to determine reporting requirements
  - Status updates established at two weeks after the end of each month
- The system for earning value was discussed with the development team and from those discussions a method of tracking CSCI milestone achievement was developed.

# Software Performance Methodology

## Use Function Points

- Function points measure how much software functionality is delivered
- Function points are an indicator of the effort required to complete the project
- Function points represent effort in software documentation, code & unit test, and functional lab test

## Map FPs to CSCIs

- Function points are counted by requirement
- Requirements can be mapped to Computer Software Configuration Items (CSCIs)
- Result: Function points by CSCI, which provides a relative weighting of each CSCI

## Code Reuse & how you go from Function Point to SLOC

- Reused code is taken into account, reducing gross function point/SLOC count to an “effective” FP/SLOC count. Effective Function Points/SLOC are denoted eFP/eSLOC
- Conversion factors enable the translation of function points to SLOC (Source Lines of Code)
- 117.8 SLOC/function point was derived after discussions with Development Team and referencing standard translation tables

# Software Performance Methodology

## Earned Progress

- Credit is given for completing intermediate milestones in the software process, CSCI Milestones, which include System Engineering and Software Engineering Milestones, this holistic approach to determining progress goes beyond relying solely on Function Points or SLOC as a means of measurement.
- Which means CSCI Milestones can be “earned” before code is created

## Implications & Summary

- Value is earned in a way that is results oriented rather than by counting code/function points
- “Heavy hitter” CSCIs that require the most effort are identified early, in a systematic way – not just by gut feel
- Schedule progress is weighted by a factor (FPs) representing effort, presenting a clearer picture of true progress

# How Milestones were Weighted

- An initial attempt at establishing weighting for program milestones was done by the metrics team
- The metrics team then conferred with the development team and refined the level-of-effort percentages to the following:

|  |                                   |
|--|-----------------------------------|
|  | = Systems Engineering Activities  |
|  | = Software Engineering Activities |

| Milestone / Activity   | SW Effort Only          | Complete Effort      |
|------------------------|-------------------------|----------------------|
|                        | Incremental FP % Earned | Incremental % Earned |
| SSS                    | 0.0%                    | 5.0%                 |
| SRS                    | 22.0%                   | 20.0%                |
| IER                    | 0.0%                    | 0.5%                 |
| Test Procedures        | 13.0%                   | 11.0%                |
| TVRTM                  | 2.0%                    | 1.0%                 |
| FER                    | 1.0%                    | 0.5%                 |
| Coding 50%             | 8.5%                    | 6.5%                 |
| Coding 100%            | 8.5%                    | 6.5%                 |
| Unit Test              | 14.0%                   | 12.0%                |
| Functional Test 50%    | 15.0%                   | 13.0%                |
| Functional Test 100%   | 15.0%                   | 13.0%                |
| Functional Test Report | 1.0%                    | 1.0%                 |
| Regression Test 50%    | 0.0%                    | 4.5%                 |
| Regression Test 100%   | 0.0%                    | 4.5%                 |
| Regression Test Report | 0.0%                    | 1.0%                 |
| SUM                    | 100.0%                  | 100.0%               |

# CSCI Earned Progress from Development Team

| 1/23/2013 Date of Analysis |      |      |      |      |        |      |      |      |      |      |      |      |      |      |
|----------------------------|------|------|------|------|--------|------|------|------|------|------|------|------|------|------|
| Actual Progress            | CSCI |      |      |      |        |      |      |      |      |      |      |      |      |      |
|                            | TTCS | SYS  | TDCL | FDCS | Router | TSYS | TPGW | SDB  | TCSP | DCL  | BCI  | STM  | TMC  | CHI  |
| SSS                        | 100% | 100% | 100% | 100% | 100%   | 100% | 100% | 100% | 100% | 100% | 100% | 100% | 100% | 100% |

- Table represents current % of milestones achieved, as of 1/30/2013
- Table includes both Systems Engineering (SSS, IER, Regression Test) and Software Engineering (everything else) milestones
- Cells highlighted in blue have changed since last reporting period
- “Weighted % Earned” is the result of the matrix multiplication of the above table with the table from the previous slide
- This status is compared to planned progress on the following slide

# CSCI Planned Progress

| Milestone / Activity     | <u>TICS</u>  | <u>SYS</u>   | <u>TDCL</u>  | <u>FDCS</u>  | <u>Router</u> | <u>TSYS</u>  | <u>TPGW</u>  | <u>SDB</u>   | <u>TCSP</u>  | <u>DCL</u>   | <u>BCI</u>   | <u>STM</u>   | <u>TMC</u>   | <u>CHI</u>   |
|--------------------------|--------------|--------------|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| SSS                      | 100%         | 100%         | 100%         | 100%         | 100%          | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         |
| SRS                      | 100%         | 100%         | 100%         | 100%         | 100%          | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         |
| IER                      | 100%         | 100%         | 100%         | 100%         | 100%          | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         | 100%         |

| Regression Test 50%      |              |              |              |              |               |              |              |              |              |              |              |              |              |              |
| Regression Test 100%     |              |              |              |              |               |              |              |              |              |              |              |              |              |              |
| Regression Test Report   |              |              |              |              |               |              |              |              |              |              |              |              |              |              |
| <b>Weighted % Earned</b> | <b>90.0%</b> | <b>44.5%</b> | <b>44.5%</b> | <b>89.0%</b> | <b>44.5%</b>  | <b>44.5%</b> | <b>90.0%</b> | <b>38.0%</b> | <b>63.0%</b> | <b>37.5%</b> | <b>37.5%</b> | <b>37.5%</b> | <b>37.5%</b> | <b>37.5%</b> |

- To determine the planned values (how much progress should have been made), we:
  - Entered the scheduled Finish Dates for each CSCI milestone into a table
  - Created a second table that compared the scheduled finish date to the current date
  - If the scheduled date was earlier than the current date, 100% was assigned for that task

# Earned vs Planned Comparison

- The “Weighted % Earned” value for each CSCI is multiplied by the total (when complete) function points for each CSCI to calculate the Earned or Planned function points at a point in time.
- The following slide details how the “earned” and “planned” function points compared

# Program Software Metrics – Earned Function Points

| CSCI            | % Earned | Completed eFPs | Planned eFPs | Planned eFPs for 3/31/2013 | eFPs when Complete |
|-----------------|----------|----------------|--------------|----------------------------|--------------------|
| <u>TTCS</u>     | 100.0%   | 4              | 4            | 4                          | 4                  |
| <u>SYS</u>      | 49.0%    | 31             | 29           | 50                         | 63                 |
| <u>TDCL</u>     | 62.1%    | 4              | 3            | 7                          | 7                  |

- Note: Progress on Systems Engineering activities is not captured by function points

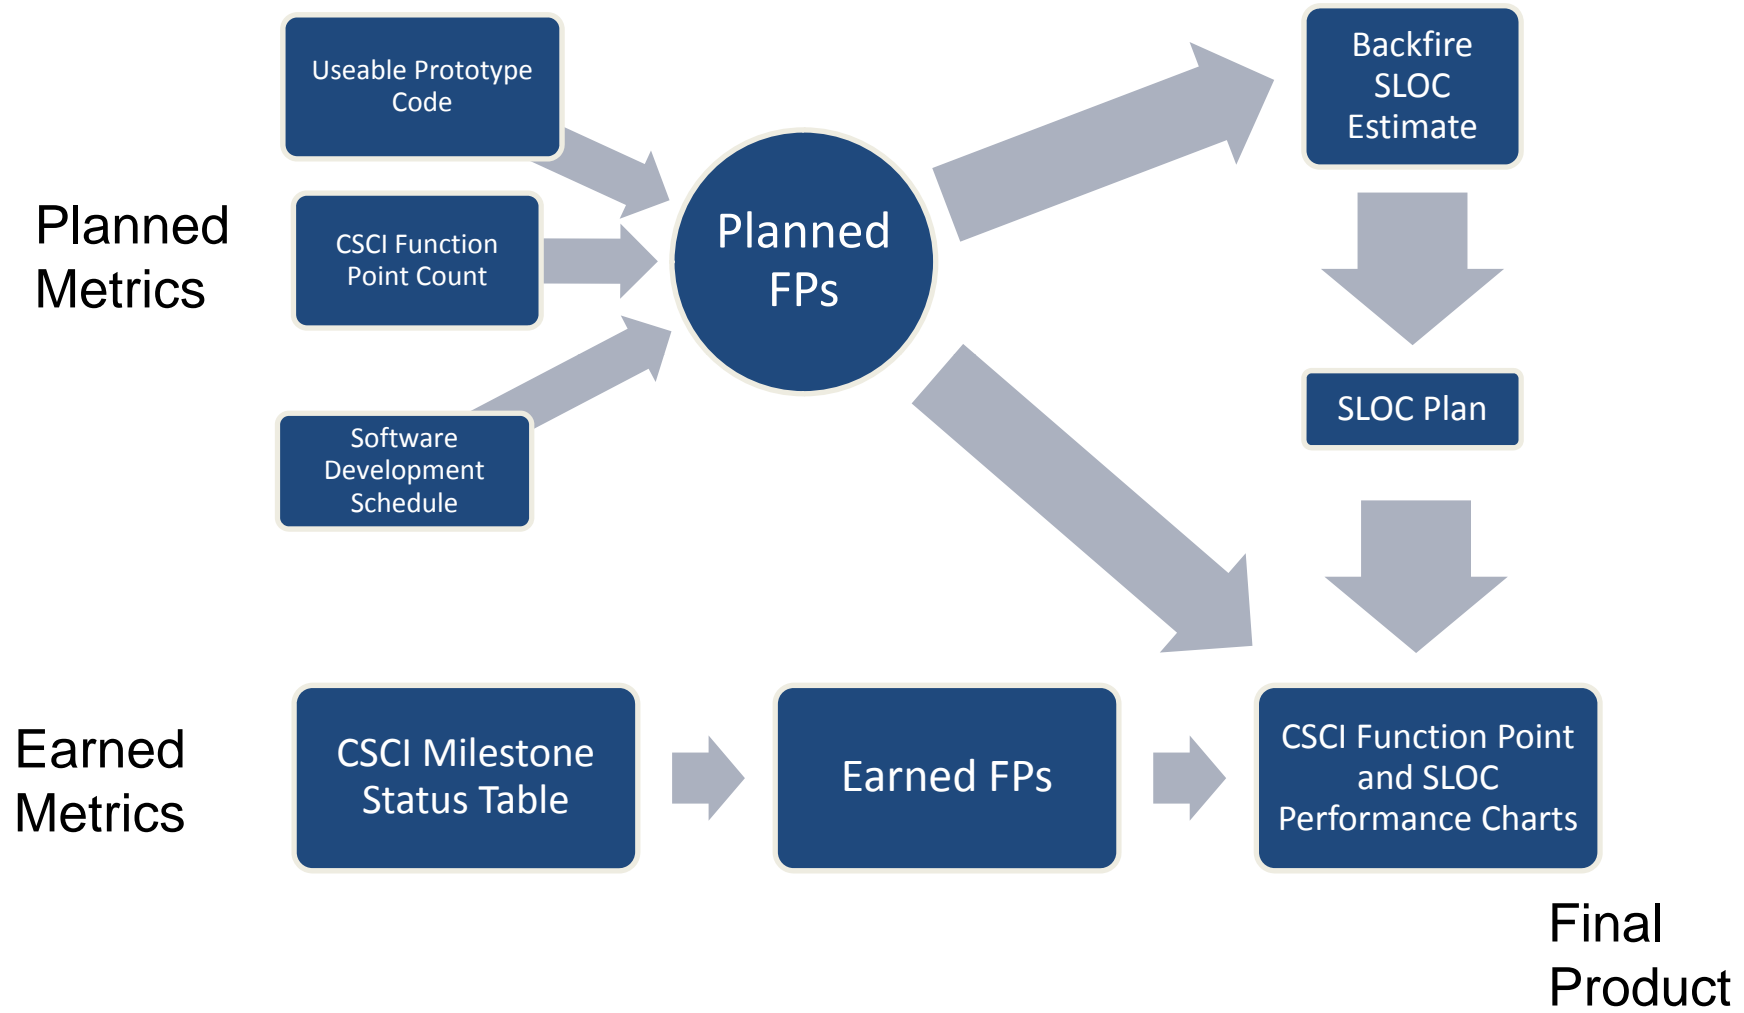

# Charting Function Point Progress

- We wanted a more graphical way of displaying progress against the plan, so we decided to chart the cumulative planned and earned function point totals each month
- PLANNED PROGRESS CURVE
  - For each CSCI, the total function points [when complete] were weighted by milestones and allocated according to the Software Development Schedule.
  - When the total of all of the planned distributions was charted, the resulting composite curve looked much like a traditional S-Curve
- EARNED PROGRESS CURVE
  - The earned function points were recorded each month and the cumulative total was overlaid on the planned progress curve

# Earned Function Points vs Planned Function Points

# SW Metrics Flow Chart Summary

# Results

- Performance was proven to be ahead of plan
  - 46.6% complete (vs. 43.3% planned) as of January, 2013
- Relationship between program office and development team improved
  - Program office became much more confident in the development team's ability to meet schedule
- Performance will continue to be tracked and reported monthly

# FP based EVM Challenges

- Increased productivity resulting from software reuse must be accounted for:
  - Original size estimate based on the user requirements was roughly 1,400 function points – unadjusted for software reuse
  - Estimate was downgraded to 760 “effective” function points after development team identified requirements addressed by pre-existing code (COTS, open-source, reused)
- Need to account for activities not directly associated with code development (Systems Engineering, System Integration)

# “Backfiring” - Function Point to SLOC Conversion

- **A number of organizations have made “backfiring” tables available to the public.**
  - These tables contain factors that convert function points to lines of code for various programming languages
- **Some tables are more complete and/or use more data points to come up with their backfiring rates.**
  - The QSM table was used for this estimate, because it used the most data points to derive its backfiring rates
- **In talking with Development Team, it was determined that the programming language blend could be approximated as follows: 75% C (107 SLOC/fp), 9% Ruby (21 SLOC/fp), 10% SQL (30 SLOC/fp), 6% Java (53 SLOC/fp),**
- **The resulting composite backfiring rate (BFR) was 88.32 SLOC/function point**
- **If we use risk ranges on the backfiring rates, the composite backfiring rate becomes 117.8 SLOC/function point**

# Risk Range on Backfiring Rates

- Backfiring rates are not given as ranges
- However, a risk range could be determined by subtracting the largest published backfiring rate from the smallest published backfiring rate.
- Backfiring rates from Capers Jones, Cost Xpert, and the David Consulting Group have also been collected by Cobec and were used to calculate a variation of 91% around the chosen QSM rates

# Benefits of Using Function Points

- Technology and language independent
- Consistent, repeatable, and verifiable
- Measures functionality the customer requests and receives
- Can use to derive metrics for cost, productivity, and quality
- Enables better management of project scope

# Advantages of Function Points over SLOC?

- No consistent rules for defining what constitutes a Line of Code (blank lines, comments)
- SLOC are language and platform dependent, older languages and platforms tend to require more LOC to deliver the same functionality
- SLOC is dependent on the experience and coding style of the individual developer
- FP counts can be developed earlier and more accurately in the project life cycle
