

Early Warning Model for Acquisition Program Cost and Schedule Growth

15 April 2008 Dan Davis

Background

- Approach
- Results
- Way ahead

Background

Prior related studies

- -The Rayleigh Analyzer, Theory and Application (Vol. 1)/ AT902C1 (Ducovich, Houser, and Lee)
 - LMI study for OSD
- The Rayleigh Analyzer, User's Manual (Vol. 2)/AT902C2 (Ducovich, Houser, and Lee)
 - User's guide for Excel Add-on by LMI

Background, cont'd

Prior related studies (cont.)

- "Final cost estimates for R&D programs conditioned on realized cost" (MOR, Vol.2, No.2, 1996, Gallagher and Lee)
- CRM D0015902.A2/Final, May 2007 ("A Stitch in Time Saves Nine: Program Diagnostics Using the Rayleigh Model for Executive Decision-Makers", Dan Davis, Gary Christle, and Wayne Abba)

Early Warning Model

Early Warning Model, cont'd

Early Warning Model

Reason for Project

• Previous study (CRM D0015902.A2/final):

- Developed prototype analytical technique
- Validated early warning utility of technique
- Developed prototype executive management tool
 - Contract assessment module
 - Plan assessment module
 - Encorporated preliminary business insights
- Demonstrated practicality of prototype
- Validated for R&D contracts only
- Used information sets that were available only early in the contract life (the 3d, 4th, and 5th submissions)
- Did not calculate standard errors or risk regions

Early Warning Model

Reason for Project, cont'd

- Sponsor liked prototype and wanted to add:
 - Criteria for when to use Rayleigh model
 - Validation using full range of information sets over entire life of contracts
 - Improved data loading instructions
 - Version 2 algorithms
 - Exploration of expanding model to:
 - Procurement contracts
 - Program level assessments
 - Expanded and improved business insight feature
 - Improved user interface

Early Warning Model

Reason for Project, cont'd

- Study tasks:
 - Collect data
 - Update optimization algorithm
 - Account for the "missing 30 percent" of cost growth
 - Calculate confidence region
 - Calculate contract cost and schedule risk
 - Develop Rayleigh spline option
 - Incorporate Over-target Baseline
 - Revalidate using information sets over entire life of contract
 - Update plan assessment module
 - Improve data upload
 - Explore use with procurement contracts
 - Explore use with program level analysis
 - Improve user interface
 - Improve and expand business insights

Early Warning Model Approach

- Update model algorithm ✓
- Confirm that Non-linear Least Squares with restricted parameters (NRP) is best implementation of model
- Revalidate with information sets over full life of contract \checkmark
 - − Confirm Rayleigh is best fit ✓
 - Confirm Rayleigh predictions are most accurate \checkmark
 - Confirm use of unadjusted data is better or as good as analysis with inflation-adjusted data
 - − Confirm model is still best even as "business practices" evolve ✓
 - Confirm Rayleigh provides reliable early warning \checkmark
 - Confirm trend of Rayleigh predictions converges ✓
 - Confirm trend of Rayleigh predictions converges the quickest \checkmark
 - Confirm trend of Rayleigh predictions is stable (non-volatile) ✓
 - Confirm Rayleigh applicability does not depend on service type \checkmark

Early Warning Model

Approach, cont'd

- Incorporate contract-level cost and schedule risk \checkmark
 - Calculate approximate standard errors and confidence regions \checkmark
 - Calculate cost risk ✓
 - − Calculate schedule risk
- Investigate use of the model with program level budget data√
- Test applicability of model to procurement contracts√
- Upgrade user interface
- Develop Rayleigh spline package for tool to account for "missing 30%"

 ✓
- Upgrade "business insight" prompts in tool√
- Explicitly link model to AOP-like management process

Summary of results

- Database consisted of 107 completed contracts
- In 100% of the contracts the NRP method outperformed unrestricted NLLS
 - NRP less volatile (more stable)
 - NRP converged faster
 - NRP gave better predictions

- Rayleigh (NRP) yields an R2:
 - Greater or equal to .9 in 93 contracts (87%)
 - Between .8 and .9 in 9 contracts (8%)
 - Between .7 and .8 in 4 contracts (4%)
 - Less than .6 in 1 contract (1%)

This means that Rayleigh NRP achieves a good fit to the data in all but 1 case out of 107.

- Database included 36 Navy, 36 AF, and 35 Army contracts
- Navy average R2=.947
- AF average R2=.951
- Army average R2=.941
- Standard t-test shows that no service average differs significantly from overall average or R2=.947

- 1970s average R2 is .96
- 1980s average R2 is .94
- 1990s average R2 is .93
- 2000s average R2 is .95
- Overall average R2 is .95

- Rayleigh (NRP) average R2 is .947
- Rayleigh with nominal data is better or almost as good as Rayleigh with real inflationadjusted data 102 out of 107 cases (95%)
 - And Rayleigh with nominal data has higher
 R2 (.947 > .933)

- Rayleigh (NRP) is best EAC generator over the life of a contract 70% of the time
 - Rayleigh NRP is best or second best 82% of the time (88 out of 107)
- EAC1 is the best 2% of the time
- EAC2 is the best 4% of the time
- EAC3 is the best 13% of the time
- The contractor is the best 4.5% of the time
- The PM is the best 6.5% of the time
 The contractor or the PM estimate profile is the
 ^{5/9/} worst 51% of the time

- All estimates converge to final realized cost and duration over time
- Rayleigh (NRP) estimate of cost converges fastest 93% of the time
- Rayleigh (NRP) is the unique leading indicator 17% of the time

The other EAC calculation methods and the contractor and the PMs estimate trends <u>never</u> are the unique leading indicator.

20

Review Rayleigh fit to data

- Criteria to evaluate
 - Fit score
 - Relative accuracy score
 - Absolute convergence score
 - Relative convergence score
 - Leading indicator score
- Give examples of good cumulative scores
- Review bad scores
 - Explain why Rayleigh doesn't appear to work
 - Develop rules of thumb for application of Rayleigh
 - Develop cautionary comments for use of Rayleigh

Cost and schedule risk (148-8)

	Cost Risk
Risk that cost will exceed PM's estimate	91%
Risk that cost will exceed PM's estimate by 10%	88%
Risk that cost will exceed PM's estimate by 25%	84%
50/50 Cost = \$910M	50%

	Schedule risk
Risk that duration will exceed PM's estimate	97%
Risk that duration will exceed PM's estimate by 10%	94%
Risk that duration will exceed PM's estimate by 25%	88%
50/50 duration= 8.5 years	50%

Rayleigh fit to program RDT&E funding profiles: Summary

- 39 programs
 - 16 Navy programs
 - 9 Army programs
 - 13 Air Force programs
 - 1 DoD program
- Overall average fit: R2 = .979
 - Navy average fit: R2 = .978
 - Army average fit: R2 = .987
 - Air Force average fit: R2 = .976
 - DoD average fit: R2 = .98

Way ahead

- Develop risk region and risk analysis
- Expand business insights
- Explore application to production contracts
- Explore application to program/budget data?

Questions/comments?

Back-up slides

Early warning model

NRP Rayleigh with nominal data gives best fit

Five cases when Rayleigh with real inflation data did noticeably better started work in 1974, 1982, 1983,1984, and 1986. Only one of these occurred during a high inflation period.

Research Task:

Questions to Be Addressed

- How can an executive effectively use questionable EVM data for management decisions?
- Can new tools be developed or "old" tools modified to give earlier warning of impending contract execution problems?

Briefing Agenda

- Summarize Rayleigh model (Version 1)
- Summarize results of validation (Version 1)
- Describe tool
 - One module for "traditional" analysis
 - One module for assessment of an original plan before actual cost data have been collected
- Potential impact of study
- Rayleigh, Version 2
- Recommendations

The Rayleigh Model

An Example of a Rayleigh Schedule

Rayleigh Model Advantages

- The model is applied only to R&D contracts
- Rayleigh is a plausible model of cumulative cost accrual over the life of a contract
- The model is based on dollars that have not been adjusted for inflation
- The model depends only on standard currently available EVM data (no new reports)
- The model only requires 3 actual cost submissions and a budget

Rayleigh Model Advantages

- The model does not depend on the reliability of Earned Value (BCWP) submissions
- The model predicts both EAC and completion date
- The model predicts the path of actuals to completion date
- The model is Excel-based using standard Solver add-in

Presented at the 2008 SCEA-ISPA Joint Annual Conference and Training Workshop - www.iceaaonline.com Validation of the Rayleigh model

- Compared accuracy of predictions considering cost at completion and completion time
- Methods compared
 - -Rayleigh estimate
 - -Contractor estimate
 - -PM Estimate

Validation (cont)

- Methods compared (cont)
 - -EAC1 (BAC/CPI plus max of contractor and PM time estimate)
 - -EAC 2 (Actuals+(BAC-EV)/(.8CPI+.2SPI) plus max of contractor and PM time estimate)
 - -EAC 3 (Actuals +(BAC-EV)/(CPI X SPI) plus max of contractor and PM time estimate)
 - Note: EAC1, EAC2, and EAC3 methods do <u>not</u> produce an independent estimate of duration time

Validation (cont)

- Selected programs for regression analyses
- Selected only R&D programs
- Selected complete programs
 - Eliminated programs less than 90% complete to get valid baselines
 - Eliminated programs with over 2 years between work start and first submission to evaluate early warning utility

Validation (cont)

- Began with entire CAS database
- Selected 74 programs
- Consisting of 115 contracts
- Earliest start date 1/1/1970
- Latest start date 8/1/2002
- All services included

Rayleigh validation results

How much better were Rayleigh predictions? (EAC)

- All estimates underestimate final cost over 78% of the time. When they underestimate cost:
 - Rayleigh underestimates final cost on average by 30%
 - The contractor underestimates on average by 35%
 - The PM underestimates on average by 37%
 - The EAC1 method underestimates on average by 34%
 - The EAC2 method underestimates on average by 34%
 - The EAC3 method underestimates on average by 32%

How much better were Rayleigh predictions? (time)

- All estimates underestimate final contract duration over 73% of the time.
 When they underestimate duration :
 - Rayleigh underestimates duration on average by 24%
 - The contractor underestimates on average by 35%
 - The PM underestimates on average by 55%

Presented at the 2008 SCEA-ISPA Joint Annual Conference and Training Workshop - www.iceaaonline.com **Conclusions from database validation**

- Rayleigh yields best estimate of final cost
- Rayleigh yields best estimate of time duration

Presented at the 2008 SCEA-ISPA Joint Annual Conference and Training Workshop - www.iceaaonline.com **Conclusions from database** validation (cont)

- Rayleigh is still short of final cost on average by 30%
- A basic assumption of all EAC techniques is that we know full scope at the time of prediction and we fit the sparse data with a single Rayleigh curve
- Earlier CNA study ("Program Cost Growth: The Navy's Experience 1983-2004")
 - Total cost growth is level from 1978-2004
 - Within the total, the "overrun" component is declining and the "changes" component is increasing
- We think the bulk of the 30% shortfall is attributable to contract changes

Executive Cost and Schedule Assessment (XCaSA) tool

- Executive Plan Assessment Module (XPAM)
 - Allows executive to assess plan realism before any actuals are submitted
- Executive Contract Assessment Module (XCAM)
 - Allows executive to assess contract performance after at least 3 submissions of actuals

- Incorporates Rayleigh estimates
- Displays "traditional" analysis for comparison
- Incorporates relevant DCMA tripwires

• Cost Overrun Vulnerability Index: $COVI = \frac{EAC_{Rayleigh}}{BAC_{N}}$

• Schedule Slip Vulnerability Index: $SSVI = \frac{\hat{t}_{Rayleigh}}{\hat{t}_{N,PM}}$

- Plan Validity Index
- "What if" drills

XCaSA advantages

- User friendly
- Interactive
- Provides useful information early in life of contract
- Uses built-in Solver add-in with widely used Excel spreadsheet software
- Provides business insights

Dashboard view of XCAM

Dashboard view of XPAM

XPAM Advantages

Only XPAM can assess the initial plan

- Current EVM diagnostics cannot assess the the plan until after submission of some number of full EVM data
 - Often more than a year after contract start

- Tested XCAM with multiple current programs
- Tested XPAM with notional initial program management baselines

Potential Impact

- Improve oversight of programs
- Obtain early assessments of plan and contract execution
- Make better informed tradeoff decisions
- Make EVM tool of choice across the government

Rayleigh, Version 2

- Update model algorithm and revalidate
- Incorporate contract-level cost and schedule risk
- Investigate use of the model with program level budget data
- Test applicability of model to procurement contracts
- Upgrade user interface
- Determine feasibility of developing Monte Carlo policy simulation package with Rayleigh spline for tool to account for "missing 30%"
- Upgrade "insight" prompts in tool
- Link model to AOP-like management process
Update model algorithm and revalidate

- Re-estimated using non-linear least squares with restricted monotonically transformed parameters (NRMP)
- Improves efficiency of computation
- Enables approximation of risk region
- Revalidated with over 2500 information sets

Update model algorithm and revalidate: results

- Rayleigh estimates final cost with greater than or equal accuracy 67.4% of the time
- Rayleigh estimates final contract duration with greater than or equal accuracy 58.5% of the time
- Rayleigh estimate of final cost converges to within 10% of the final actual cost with greater than or equal speed 92% of the time
- The average speed of convergence for the Rayleigh final cost estimate is .48

Results of more comprehensive analysis

Average R^2=.93

Model: r_2=a + b*WSDATEINDEX

a_hat:	b_hat:
.95	00126
(.038108)	(.001978)

- Compared Rayleigh with "level of effort" model
- Rayleigh a better "fit" 63% of the time
- Rayleigh better or virtually the same "fit" 85% of the time
- Linear model is unambiguously better "fit" 15% of the time

- Estimated covariance matrix
- Calculated confidence ellipse in parameter space
- Mapped ellipse into "final-cost/finalduration" space
- Graphed confidence region
