

# ENTERPRISE WIDE COST MODELING: A SYSTEMS ENGINEERING PERSPECTIVE

**Yousuf S. Mohammed, Han P. Bao**  
Mechanical Engineering Department,  
Old Dominion University, Norfolk, VA.  
[yousufshaker@gmail.com](mailto:yousufshaker@gmail.com)  
[hbao@odu.edu](mailto:hbao@odu.edu)

# OUTLINE

- Enterprise Wide Cost Modeling is approached from a systems engineering stand point.
- Risk and uncertainty, maintainability, reliability and other ‘-ilities’ are applied to the core cost.
- A hierarchy of units is setup: System-Product-Assembly-Object.
- The cost model caters to the needs of cost estimation at every stage of the life cycle and for every kind of product, big or small, simple or complex.

# OUTLINE Continued

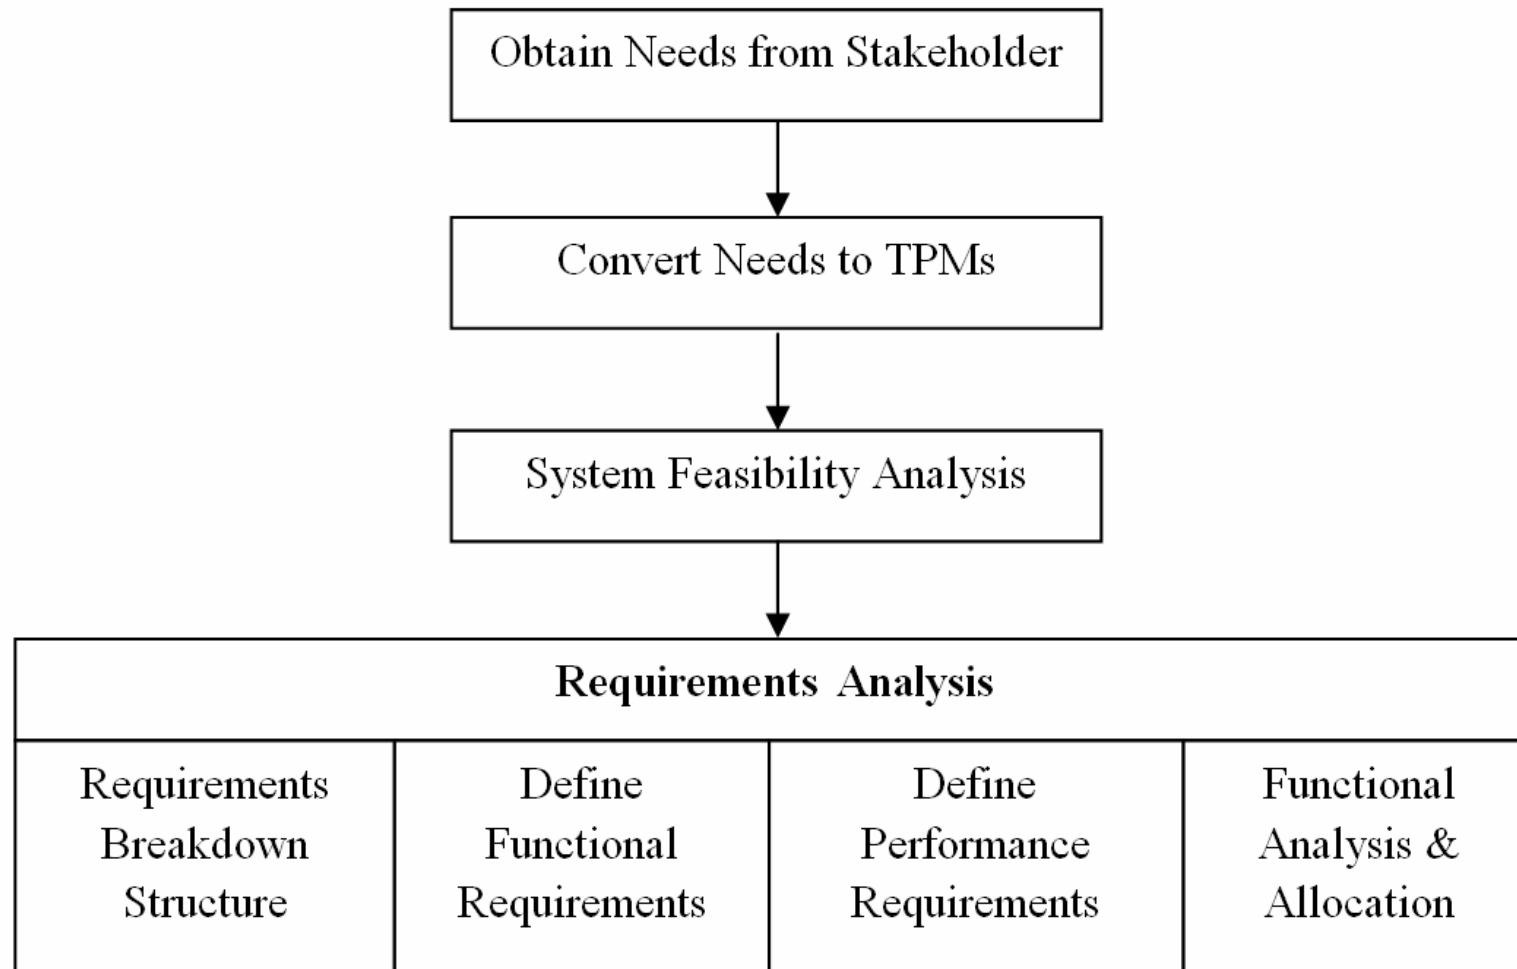

- New process selection tools have been added to the field of cost estimation which suggests the user with applicable processes given the material and production quantity.
- Attributes such as materials, fabrication processes etc... are ontology based. This is very useful since, in the preliminary stages of cost estimation, not much information is available.

# SYSTEM HIERARCHY AND UNITS

- System
- Sub-system/Product
- Assembly
- Part/Object

# SYSTEMS ENGINEERING PROCESS

# METHODOLOGY

- The unit whose cost is to be estimated is the Target unit.
- A broad search is conducted to see which units are similar to the target unit. (Model Units)
- Among the model units, one candidate is chosen on the basis of its functional metrics being closest to that of the target's.

# COMPARING FUNCTIONS

Target	Model 1	Model 2	Model 3	Model 4	Model i
F1	X	X	X	X	X
F2	X	X		X	
F3	X		X	X	X
F4		X	X		
.	X				
.					
.	X				
F <sub>n</sub>					

An X means that the functionality F<sub>i</sub> of the Target unit is present in the Model unit

# WEIGHTED RANKING OF MODELS

TPM Metrics Comparison	Target	Model1	Model2	Model3	Model4	Model i
	F1	2	3	5	3	1
	F2	3	8		7	
	F3	1		7	4	6
	F4		3	9		
	.	6		5	6	4
	.		4			
	.	6	5	3	4	6
	.		5		3	8
	Fn	8		4		2
SUM→	26	28	33	27	27	

The Model that has the highest weighted rank sum is the candidate model whose samples are to be collected.

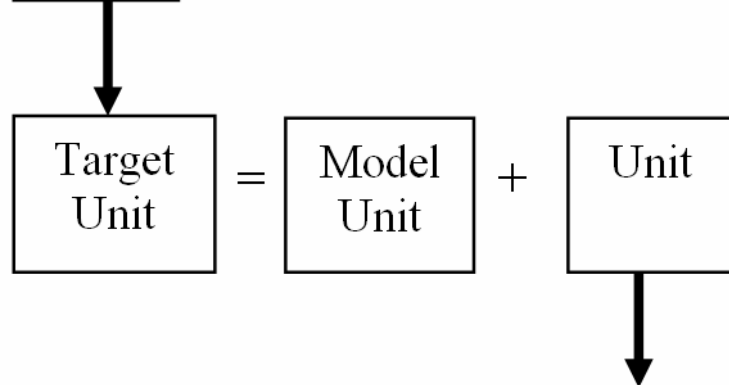

# REPEATABILITY

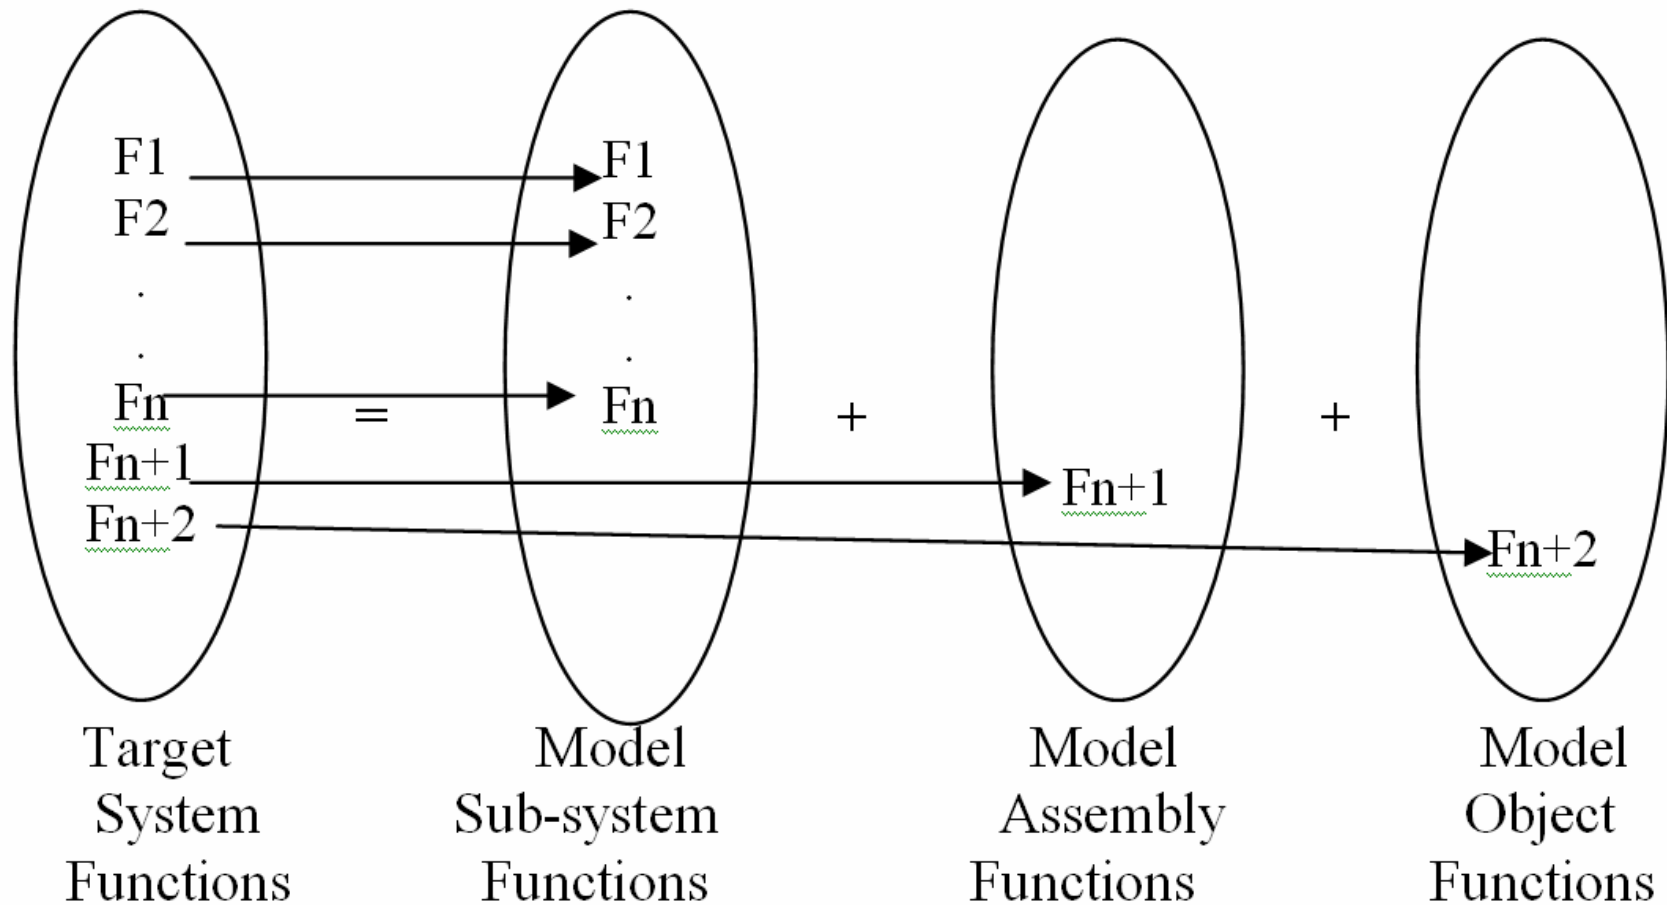

Not all functions of the Target unit are Available in the Model unit. The rest of The functionalities are obtained through A separate unit.

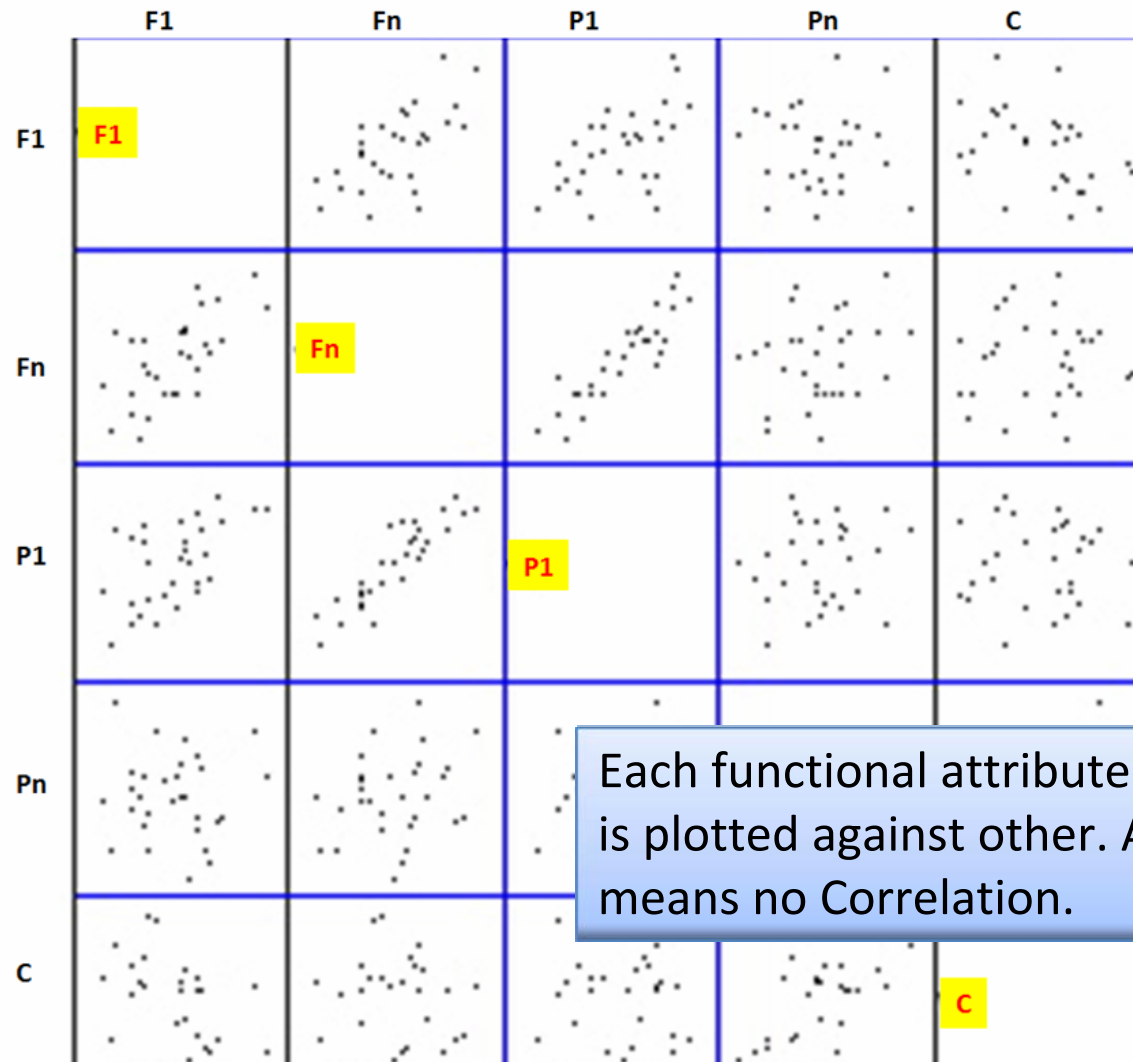

The separate unit in turn becomes a target unit. And Models similar to it are searched and selected

# TARGET SYSTEM FUNCTIONALITIES

# CORRELATION

Each functional attribute data (of Model sample) is plotted against other. A random scatter means no Correlation.

# SAMPLE MATH MODEL

Obtain the cost-coefficient matrix K and apply to target attributes to Obtain cost of the target unit.

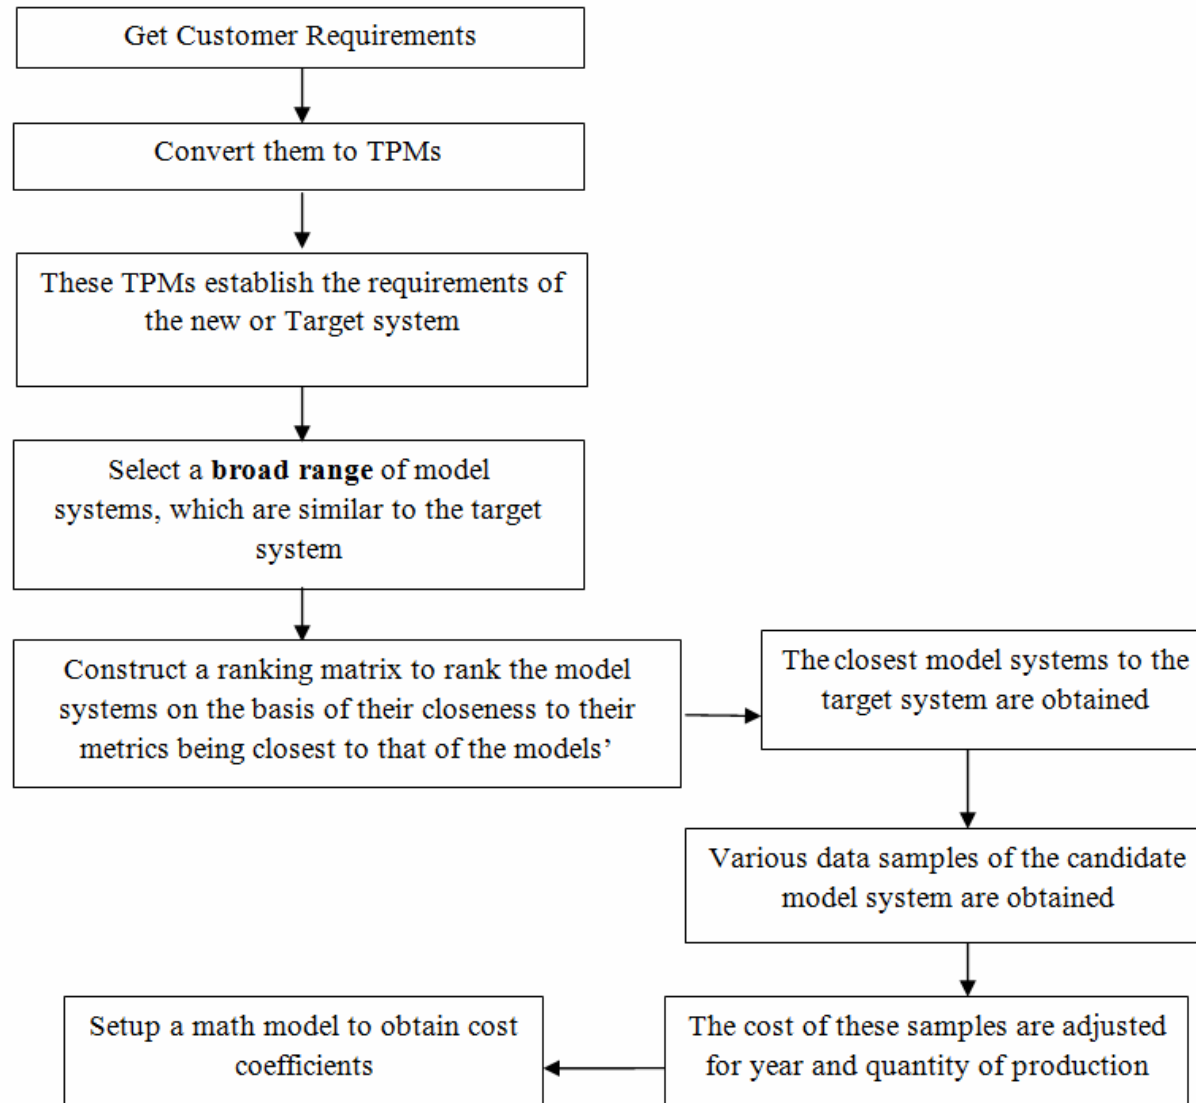

$$\begin{pmatrix}
 F_1^1 & F_{2\dots}^1 & P_1^1 & P_{2\dots}^1 & R_1^1 & R_{2\dots}^1 \\
 \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\
 F_1^Q & F_{2\dots}^Q & P_1^Q & P_{2\dots}^Q & R_1^Q & R_{2\dots}^Q
 \end{pmatrix}
 \times
 \begin{pmatrix}
 K_1 \\
 K_2 \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 K_n
 \end{pmatrix}
 =
 \begin{pmatrix}
 C^1 \\
 C^2 \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 \vdots \\
 C^Q
 \end{pmatrix}$$

$F_1^1 \dots F_{Q_1}^Q$  Metric of Function-1 for the samples 1 to Q  
 $P_1, P_{2\dots}$  Physical Attributes of Sample  
 $R_1, R_{2\dots}$  Metrics of Reliability & Maintainability of the samples  
 $C_1, C_2\dots$  Cost of samples

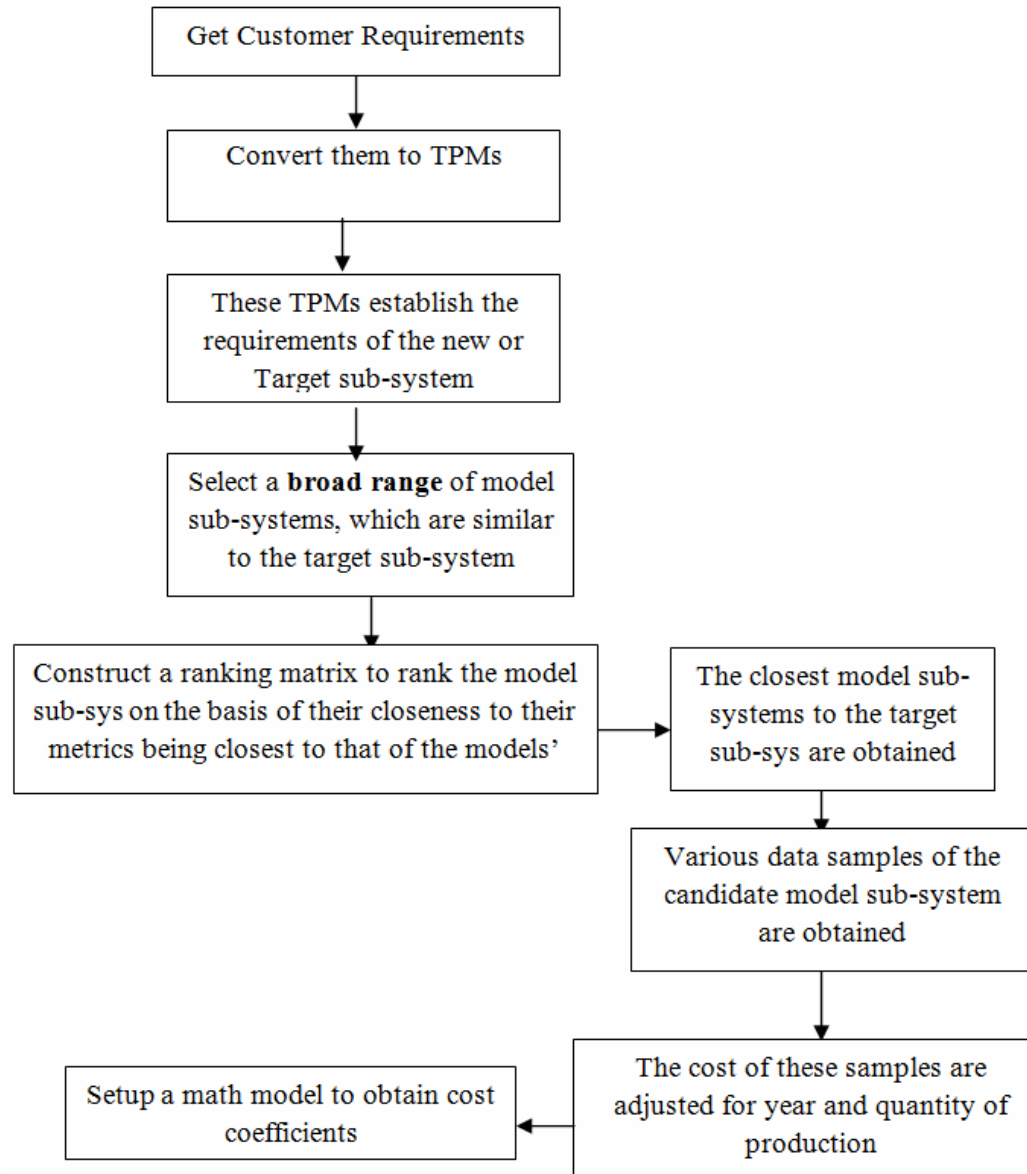

$$\text{Cost of Target} = K_1 F_1^T + K_2 F_2^T + \dots + K_j P_1^T + K_j P_2^T + \dots + K_g R_1^T +$$

$F_1^T, F_2^T\dots$ Functional Metrics of Target	$P_1^T, P_2^T\dots$ Physical Attributes of Target
$R_1^T R_2^T\dots$ Metrics of Reliability & Maintainability of Target	

# SYSTEM-LEVEL METHODOLOGY

# SUBSYSTEM-LEVEL METHODOLOGY

# SUBSYSTEM LEVEL EXAMPLE

As an example a cost model of a Rotary Air compressor is developed here. The data is collected from *MSC 2002/2003 Industrial Supply Co. catalogue*

	Rotary Air Compressor		
	CFM	HP	PRICE(\$)
1	27	7.5	5015
2	35	10	6545
3	53	15	6824
4	79	20	7912
5	97	25	8361
6	112	30	9256

Model Samples for Rotary Air Compressor

The first five records were used to come up with a cost model and it was used to predict the cost of the sixth item. The cost model setup was a simple MLR.

# SUBSYSTEM LEVEL EXAMPLE

R Square	0.90
Adjusted R Square	0.80
Coefficients	
Intercept	4,055.37
CFM	-35.07
HP	317.22

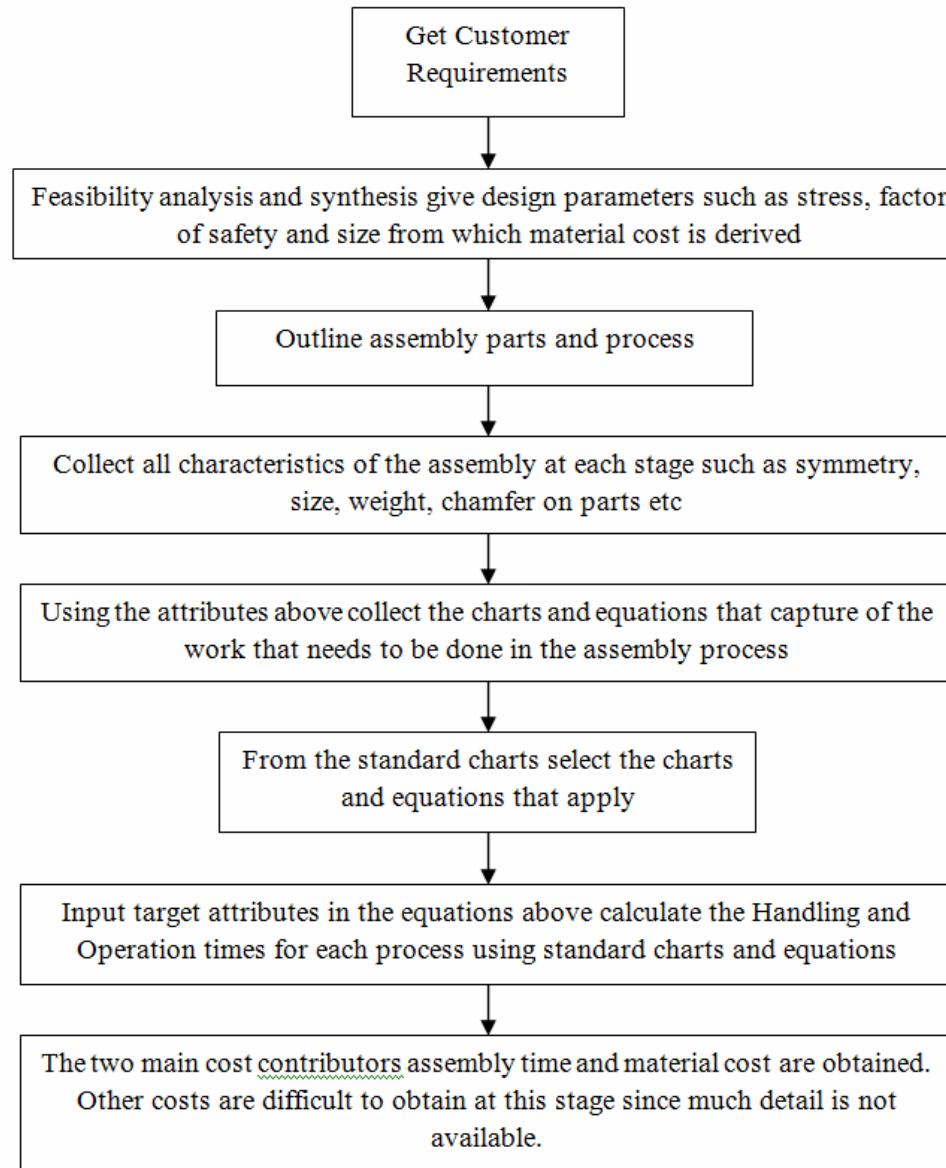

Results from MLR

$$\text{Cost} = 4055.37 + (-35.07) * (\text{CFM}) + 317.22 * (\text{HP})$$

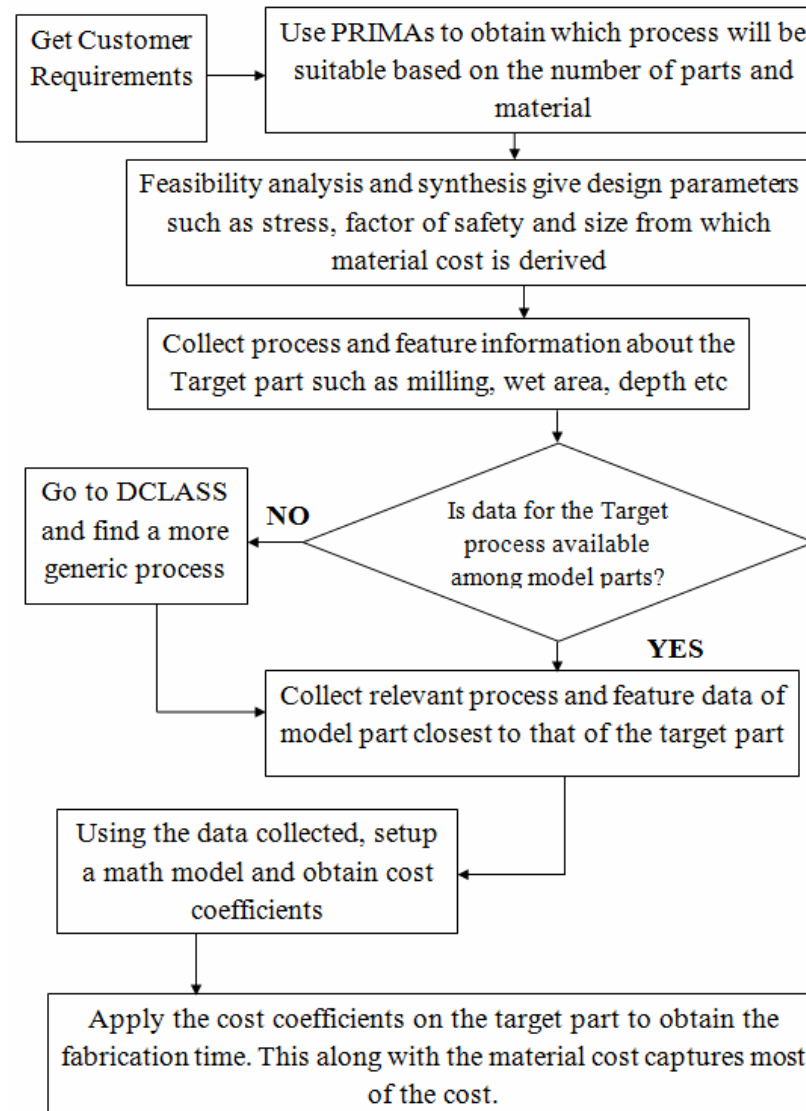

When this model is applied to the sixth sample of the data (CFM of 112 and HP of 30) the cost comes to **\$9,645** which is 5% off from the actual cost of **\$9,256**.

# ASSEMBLY-LEVEL METHODOLOGY

# PART-LEVEL METHODOLOGY

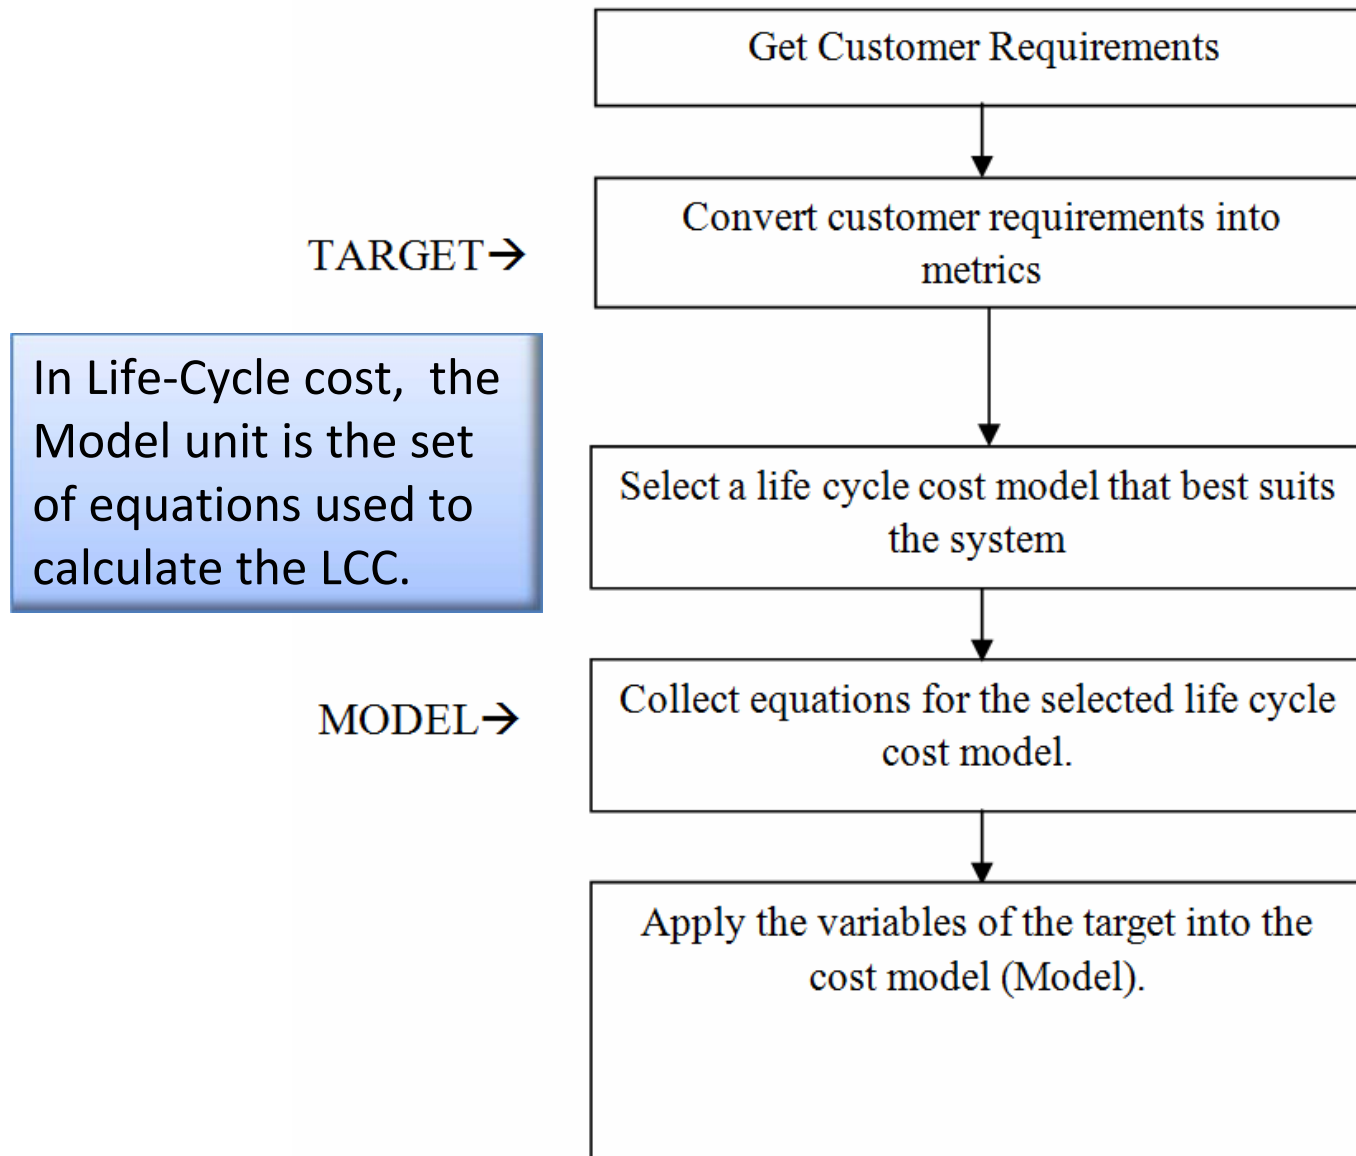

# DCLASS

Fabrication part of the DCLASS (Decision Classification)

<b>Mass Reducing</b>	<b>Mechanical Reducing</b>	<b>Reduction (Chips)</b>	<b>Single-Point Cutting</b>	Turning Facing	101
			Boring	102	
Shaping/Planing	103				
parting/Grooving	104				
Threading (SP)	105				
<b>Multi-Point Cutting</b>	Drilling		111		
	Reaming		112		
	Milling/Routing		113		
	Broaching		114		
	Threading		115		
	Filing	116			
	Sawing	117			
	Gear Cutting	118			
<b>Abrasive machining</b>	Grinding	121			
	Honing	122			
	Lapping	123			
	Superfinishing	124			
	Ultrasonic Machining	125			
	Jet Machining	126			
<b>Separation Shear</b>	<b>Shearing</b>	Squaring	131		
		Slitting	132		
		Rotary Shear	133		
		Nibbling	134		
<b>Blanking</b>	Conventional Blanking	141			
	Steel-Rule-Die Blanking	142			
	Fine Blanking	143			
	Shaving/Trimming	144			
	Dinking	145			
<b>Piercing</b>	Punching	146			
	Perforation	147			
	Lancing	148			
	Notching	149			

# LIFE-CYCLE COST

# FUTURE WORK

- Make the framework more robust.
- Develop Sub-system level ontology similar to DCLASS.
- Simulate building of the system in a virtual environment.
- Database methodology to link data at each hierarchical level.
- A software that can build, interpret and estimate cost of a system.
