Introduction

- ▶ In project management, the schedule should be a central tool that effectively communicates the state of the project and provides team members with a means to make informed decisions
- ▶ However, scheduling is often under utilized due to the following reasons:
 - Schedules are overlooked by team members
 - Schedule inception and baseline are flawed
 - Correct usage and status of the schedule is incorrect
 - Schedule reports may be developed that hide reality
- ▶ When these factors are true, a schedule is not viable as a platform for risk analysis
- ▶ This study discusses methods ensuring validity of project schedules prior to integrating risk

Table Of Contents

- ▶ Introduction

- ▶ The Assessment

- Stakeholder Involvement
- Schedule Structure & Organization
- Analyzing Schedule Health
- Technical Deep Dive

- ▶ Conclusion

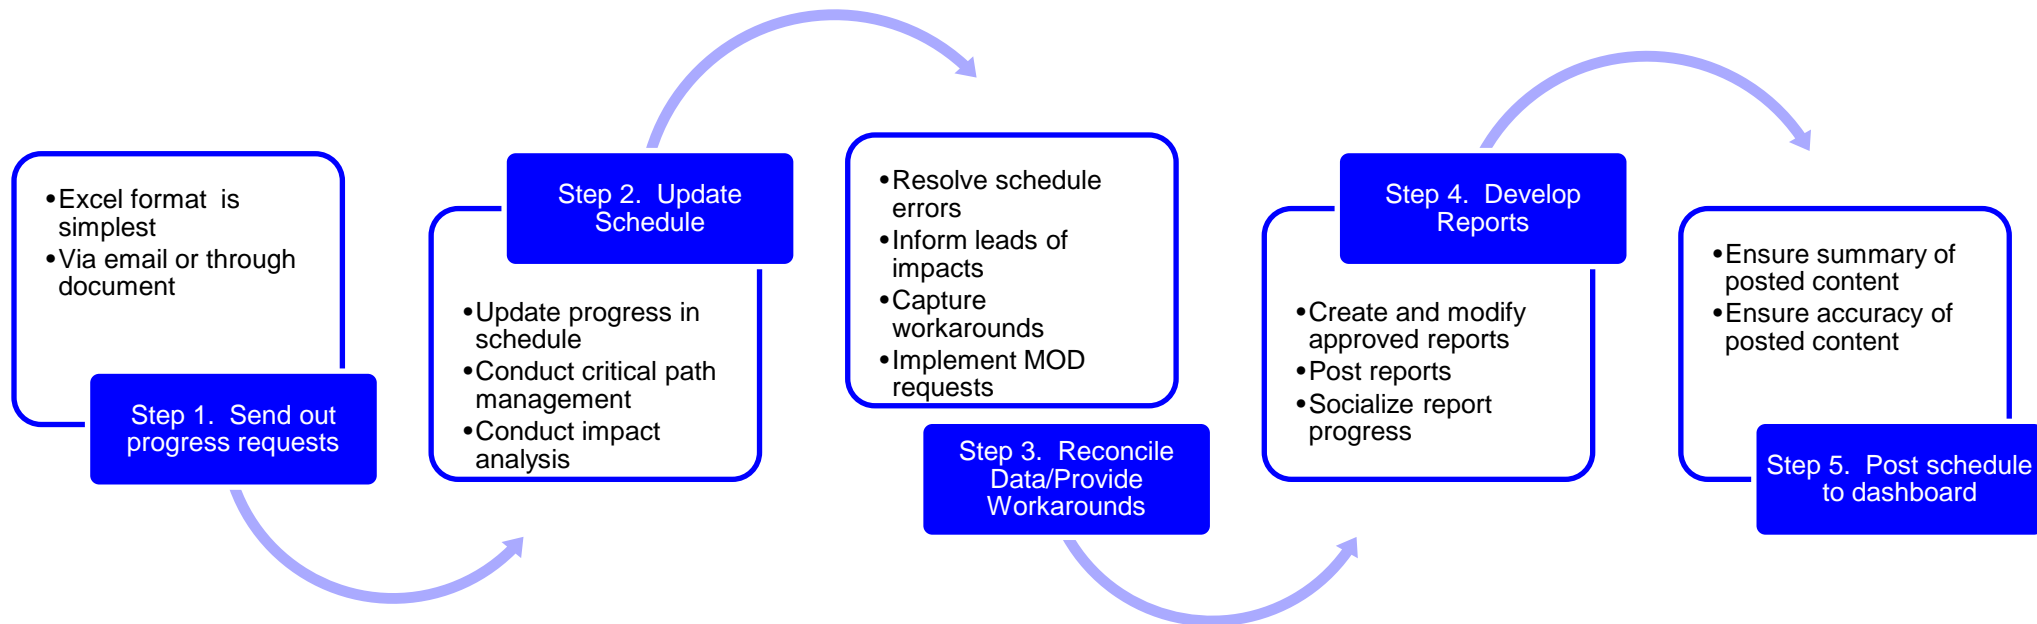

Stakeholder involvement

- ▶ A schedule assessment should first begin during a stakeholder analysis

- ▶ An analyst should focus on the following:
 - Who is developing and maintaining the schedule?
 - How much interest does leadership have in the schedule?
 - Is the schedule communicated clearly to team members?
 - Are project roles identified in the schedule?

Next, how does the scheduler/planner communicate the schedule?

- ▶ The following should be identified:
 - Frequency and timeline (data should be updated every two weeks at a minimum, every week at a maximum, or at client's request)
 - Are there any efficiencies that can improve the process
 - Most Importantly for risk: Where does risk fit in??

A Schedule Management Plan should exist and must be approved by program officers

- ▶ The schedule management plan details the processes, standards, tools and techniques required for schedule development
- ▶ Standardizes approach to new schedules
 - Helps prevent negative auditing from external agencies
 - Defines schedule roles for team
- ▶ Clearly states how risks should be handled in the schedule

SCHEDULE MANAGEMENT PLAN

1. Introduction

2. Overview

2.1. Purpose

2.2. Scope

3. Basis for Schedule Management Plan

3.1. Assumptions

4. Definitions & Acronyms (Pull from PME, other documents)

5. Schedule Management Approach

5.1. Roles & Responsibilities

A schedule should follow a rigid Work Breakdown Structure

- ▶ The WBS is a hierarchical breakdown of the work to be performed by the project team to accomplish project objectives using required deliverables
 - A schedule should be organized from the WBS into a lower level that can be planned, managed, and controlled (work package)
- ▶ A WBS should be deliverable oriented, not organizationally based
 - The WBS should describe what is going to be delivered, produced, completed, etc
 - Teams or offices should not make up the WBS elements
 - Schedule milestones should trace back to the WBS

Developing an OBS will assist in project management and control

- ▶ An Organizational Breakdown Structure helps define roles and serves as the basis for responsibility relationships in the program
- ▶ This needs to be a preliminary step in process improvement so that the team can formally designate work, and begin to take ownership of schedules and resources

Once the WBS and OBS have been decomposed, the two tools can be merged to form a Responsibility Assignment Matrix

- ▶ The RAM integrates the lowest level WBS and the OBS
 - The RAM assigns specific responsibility to project offices
 - Each “X” indicates the intersection of the deliverable and the resource, providing clear expectation of who will perform what work
 - From this activity, risks can be assigned and directly linked to the schedule

WBS (Products/Services)

| | | WBS (Products/Services) | | | | | | |
|-------------------------|--------------|---------------------------|------------------------------------|---|--|---|--|------------------------------------|
| | | Generate Funding 1.1.1 | Identify Opportunities 1.1.2 | Develop Programmatic Ideas 1.1.3 | Conduct Performance Improvement 1.1.4 | Develop Programmatic Initiatives 1.1.5 | Manage Post Closing Leases 1.1.6 | Conduct Public Affairs 1.1.7 |
| Office | Lead | | | | | | | |
| Foundation | Mark Smith | | | X | | X | | |
| Post Closing Management | Jane Doe | | | | | | | |
| Innovation | John Doe | | | X | | | | |
| Business Development | Larry Davis | X | X | | | | | |
| Performance | Michael Hall | | | | X | X | | |
| Advocacy | David Jones | | X | | | | | X |
| Project Execution | Buzz Aldrin | X | | | | | | |

Note: the further a WBS is decomposed, the better the distinction between work responsibility

OBS(Resources)

Why do the WBS/OBS/RAM matter in a schedule assessment?

- ▶ In a schedule assessment, auditors must determine whether the schedule reflects how overall scope is impacted
 - A well-defined, deliverable oriented WBS provides the framework for schedule and cost fidelity
 - Managers have better traceability to project scope, ensures that all scope is captured
 - The quality of schedule summaries is increased
 - Helps distinguish project goals and establish deliverables and milestones

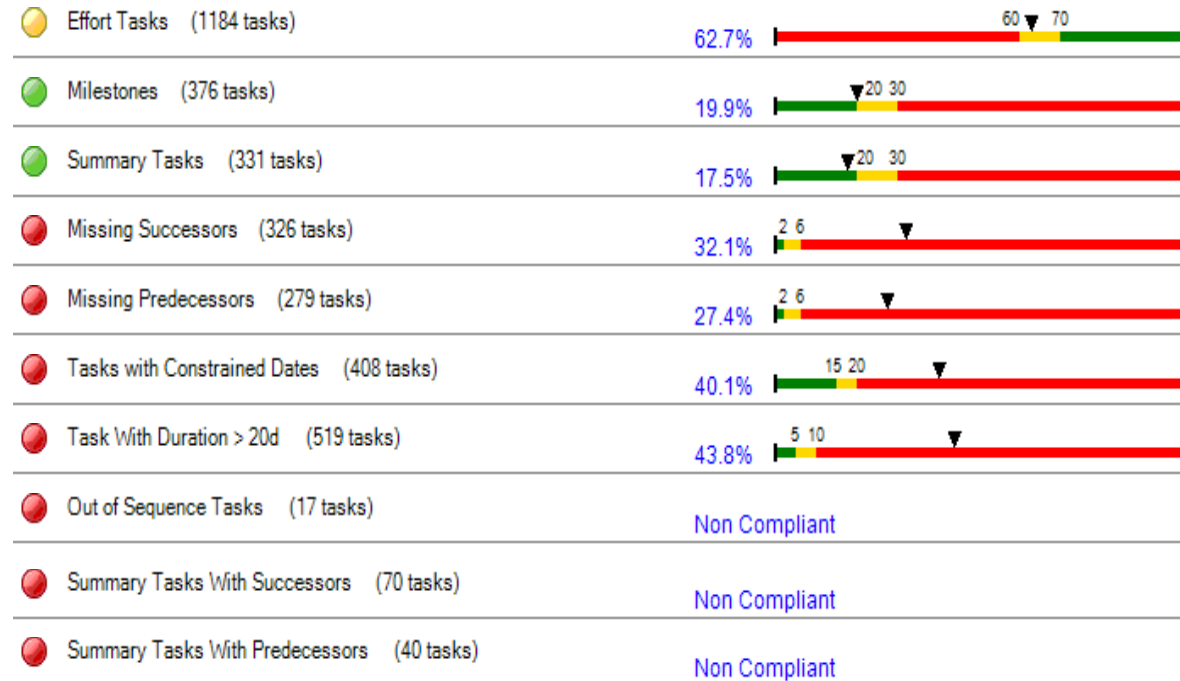

- ▶ For risk managers: does each risk correspond to an area in the schedule?

When a schedule file has been received, an analyst must then conduct a schedule health assessment

- ▶ What is schedule Health?
- ▶ Schedule health is the notion that a project schedule contains a fluid, logical activity network, discernable criticality, and accurate duration estimates that enables a project team to confidently plan for the achievement of project finish.
- ▶ Validating schedule health is a necessary precursor to conducting schedule studies such as risk sensitivity analysis, schedule performance metrics (EVM), and baseline change management
- ▶ Below are the factors that should be checked in a schedule health assessment
 - Use of constraints
 - Existence of open-ended activities
 - Valid activity network/logic
 - Broken logic (out of sequence activities)
 - Valid activity durations (including lead, lag, and float)
 - Understandable critical path
 - Representative of project scope and relative to WBS

How are schedules benchmarked?

- ▶ Results of a schedule check report should be reviewed with the project team
- ▶ The fields listed here are the top concerns from a recent schedule health assessment. These are elements of scheduling that need to be sound in order to study the critical path, and eventually risk exposure
 - Other items include negative lag, SPI, CPI, resource assignments, etc.

Constraints are key to understanding project reality

- ▶ A major finding from the example is that 40% of activities in the schedule (408 activities) are constrained
 - Overuse of constraints disrupts the logical flow of the schedule, and impacts may not be realized
- ▶ The constraint feature in scheduling tools should be used as optimally as possible, and should address the following
 - Factors that will limit the project team's options such as schedule milestones with imposed completion dates either by management or contract
 - Environmental factors inherent to the project
- ▶ Goldratt's theory of constraints is often cited as a method to understand project constraints, not necessarily related to activity constraints in the schedule
 - Project activities are affected by at least one constraint at any given time, but the actual number of constraints on a given project is fairly low

The critical path can become disjointed due to use of constraints

▶ The dates here are maintained by “must finish on” constraints

| | | | | | | | |
|-----|--|------|----------|--------------|--------------|-----------------------|-----|
| 189 | FAA Certification | 0% | 307 days | Mon 3/2/09 | Wed 4/28/10 | As Soon As Possible | |
| 190 | Demo C1 FAA Reentry Package Submission | 100% | 0 days | Mon 3/2/09 | Mon 3/2/09 | Start No Earlier Than | 3/2 |
| 191 | Demo C1 Reentry Package Certified | 0% | 6 mons | Mon 3/2/09 | Tue 8/11/09 | As Soon As Possible | 19 |
| 192 | Demo C2 FAA Package Submission | 0% | 0 days | Mon 7/6/09 | Mon 7/6/09 | Start No Earlier Than | 76 |
| 193 | Demo C2 package finalization | 0% | 48 days | Mon 7/6/09 | Mon 9/7/09 | As Late As Possible | 19 |
| 194 | Demo C2 Certified | 0% | 6 mons | Mon 4/27/09 | Mon 10/5/09 | Must Finish On | 19 |
| 195 | Demo C3 FAA Package Submission | 0% | 0 days | Tue 9/1/09 | Tue 9/1/09 | Start No Earlier Than | 91 |
| 196 | Demo C3 package finalization | 0% | 42 days | Tue 9/1/09 | Wed 10/28/09 | As Late As Possible | 19 |
| 197 | Demo C3 package processing | 0% | 130 days | Thu 10/29/09 | Wed 4/28/10 | As Late As Possible | 19 |
| 198 | Demo C3 Certified | 0% | 0 days | Mon 2/1/10 | Mon 2/1/10 | Must Finish On | 19 |

▶ Once the constraint is changed to “start no earlier than,” the dates slip out by two months due to the logic in the schedule

| | | | | | | | |
|-----|--|------|----------|--------------|--------------|-----------------------|-----|
| 189 | FAA Certification | 0% | 307 days | Mon 3/2/09 | Wed 4/28/10 | As Soon As Possible | |
| 190 | Demo C1 FAA Reentry Package Submission | 100% | 0 days | Mon 3/2/09 | Mon 3/2/09 | Start No Earlier Than | 3/2 |
| 191 | Demo C1 Reentry Package Certified | 0% | 6 mons | Mon 3/2/09 | Tue 8/11/09 | As Soon As Possible | 19 |
| 192 | Demo C2 FAA Package Submission | 0% | 0 days | Mon 7/6/09 | Mon 7/6/09 | Start No Earlier Than | 76 |
| 193 | Demo C2 package finalization | 0% | 48 days | Fri 7/31/09 | Fri 10/2/09 | As Late As Possible | 19 |
| 194 | Demo C2 Certified | 0% | 6 mons | Mon 10/5/09 | Fri 3/19/10 | Start No Earlier Than | 19 |
| 195 | Demo C3 FAA Package Submission | 0% | 0 days | Tue 9/1/09 | Tue 9/1/09 | Start No Earlier Than | 91 |
| 196 | Demo C3 package finalization | 0% | 42 days | Tue 9/1/09 | Wed 10/28/09 | As Late As Possible | 19 |
| 197 | Demo C3 package processing | 0% | 130 days | Thu 10/29/09 | Wed 4/28/10 | As Late As Possible | 19 |
| 198 | Demo C3 Certified | 0% | 0 days | Wed 4/28/10 | Wed 4/28/10 | Start No Earlier Than | 19 |

▶ Scheduling software has difficulty accounting for true criticality in this case. This type of constraint forces the achievement of a date, rather than showing impact and reality of completing on time

Open ended activities require further development of the schedule

- ▶ In the data, 32% of activities are missing successors, 27% are missing predecessors, ie., left “open”
 - Open ended activities destroy logic in a schedule, and should lead to a milestone (completion, delivery, handoff), otherwise, the existence of these activities are in question

- ▶ Findings such as these will drive a “deep dive” into the schedule logic
 - Missing logic must be reviewed, otherwise, the impact of a logical path could not be realized
 - New logical relationships must be imposed after discussions with a Subject Matter Expert
 - Often, activities will need to be removed from the schedule, this also must be done carefully

- ▶ “Out of sequence” or items with “broken logic” are activities that are not updated after their predecessor completes
 - It is recommended that any broken logic be removed or corrected to ensure the logic flows as expected

Duration estimates and activity types need to accurately capture work

- ▶ In the example, the length of duration is in question – 519 activities are greater than 20 days
- ▶ What type of duration estimation method was used?
 - Expert Judgment
 - Analogy Estimate
 - Parametric Estimate
 - *3-Point Estimate
 - Reserve/Contingency Estimate
- ▶ In order for an activity to capture the nature of the work being performed, it must reflect the correct level of effort that is required to deliver a product or service
 - Long duration may be acceptable in activities that are “Level of Effort,” where work is more routine
 - Activities that are “discrete” need to reflect what is being performed in a manner that shows impacts of delays, changes in course of direction, and accomplishments
- ▶ In the sample schedule, the ratio of milestones to duration activities is acceptable, at 19%
 - A general rule of thumb is less than 20% of the activities marked as milestones
 - This promotes the possibility that logically linked paths are feeding milestones as end products
 - Activities must be separated into events and duration bearing items

Schedule Assessment Software

- ▶ There are a number of software that will provide a fast schedule health check
- ▶ Those results need to be communicated with the team, and used as a guideline into deeper issues
 - Any software can only present a certain level of insight into a project; it is the job of the analyst to identify the root cause of project issues

A “deep dive” into the schedule should be a thorough look into the activity network sequence

- ▶ The interviews for dependency definition must be conducted with the proper technical leads of each work package, these points of contact should be subject matter experts, and have vested knowledge in the objectives of the project
 - Dependencies need to be divided into mandatory, preferred, and external

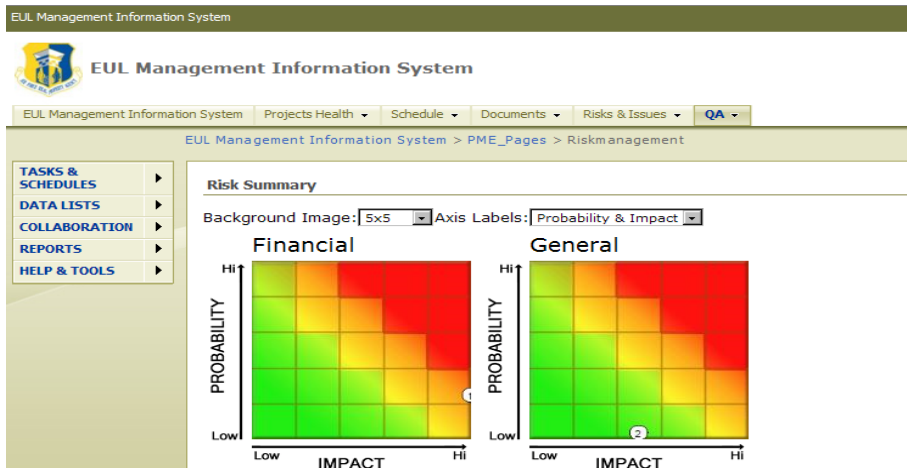

- ▶ To provide meaningful results, the work content must be evaluated
 - Despite resolving schedule health issues, the focus must still remain on the work content in the schedule
 - This involves researching key technologies and the impacts they could have on the project

Evaluation of the critical path helps understand the project

- ▶ Once content is validated in the schedule, communicating the critical path to the client becomes simpler, and a more accurate ability to exploit risks in the critical path exists
- ▶ Sample Critical Path Statement:
 - *“The critical path in the schedule follows Qualification testing for the DRACO thrusters and FAA certification. This leads into C2/C3 Hot fire testing, feeding the propulsion system fabrication/testing/integration, finally culminating to final integration, targeting the fall of 2010 for the Demo flight”*
 - *“...However, the DFI deferred activities only contain 13 days of total float in the path to the Demo flight and the critical path will change if the DFI deferred items begin to slip more than 13 days*
 - *...This small amount of float is realistically becoming smaller, which will push the DFI installation onto the critical path*

Below, risks are loaded into a dashboard; this can be sent to a risk analysis tool

- ▶ Risk scoring data is captured in one tool, then exported to another tool for further analysis

The screenshot shows the Pertmaster Risk Register interface. It features a table of risks with columns for ID, T/O, Title, Probability, Schedule, Score, Response, Post-mitigation (Probability, Schedule, Cost, Score), and Details. Below the table, the 'Risk Details' section provides a breakdown for a specific risk (IET-005).

| Risk | Pre-Mitigation (Data Date = 30-Dec-08) | Mitigation | Post-mitigation | Details | | | | | | | | |
|---------|--|--|-----------------|----------|-------|----------|-------------|----------|------|-------|---|--|
| ID | T/O | Title | Probability | Schedule | Score | Response | Probability | Schedule | Cost | Score | Cause | Effect |
| IET-001 | F | Vaporizer Drawing Approval | M | M | 20 | Accept | M | M | H | 20 | The customer approval process takes longer for the vaporizer drawings | The vaporizer schedule is delayed |
| IET-002 | F | Stainless Steel Delivery for Vaporizers | M | M | 20 | Accept | M | M | H | 20 | The stainless steel manufacturer is behind on their steel fabrication | Stainless steel is delivered late |
| IET-003 | F | Thermax Delay in Development | M | M | 20 | Accept | M | M | H | 20 | The vendor, Thermax takes longer to develop parts for the vaporizers | delay in the vaporizer schedule activities. |
| IET-004 | F | RATF Main Sliding Door Seal Bulge | H | VH | 60 | Accept | H | VH | VH | 60 | A bulge occurs in the RATF main sliding door seal | The team has to reveal if the door seals. |
| IET-005 | F | NASA Review of Construction Submittal Stack Up | H | VH | 60 | Accept | H | VH | H | 60 | NASA may be unable to complete all submittal reviews in 1 month | NASA reviews occur serially, extend schedule |
| IET-006 | F | RATF Main Sliding Door Seal O2 Levels | M | L | 40 | Accept | M | L | VH | 40 | Malfunction in pressurization system | The door seals begin to lose O2 pressure |
| IET-007 | F | RATF Main Sliding Door Seal Noise Increase | M | L | 40 | Accept | M | L | VH | 40 | Malfunction in pressurization system | Troubleshoot and repair in the field |

Risk Details for IET-005: NASA Review of Construction Submittal Stack Up

| | | | | |
|---|---|--|-----------------------------|----------------------|
| Cause | Description | Effect | Threat / Opportunity | Manageability |
| NASA may be unable to complete all submittal reviews in 1 month | Given that the schedule has several NASA reviews occurring simultaneously over a 1 month period, NASA may be unable to complete all reviews in time, which would cause the reviews to be done serially. | NASA reviews occur serially, extend schedule | Threat | Unassigned |

Pre-mitigated position:
 Probability: H (50% to 70%), Score: 60
 Schedule: VH (20 or higher), Score: 60
 Cost: H (\$50,000 to \$75,000), Score: 60

Post-mitigated position:
 Probability: H (50% to 70%), Score: 60
 Schedule: VH (20 or higher), Score: 60
 Cost: H (\$50,000 to \$75,000), Score: 60

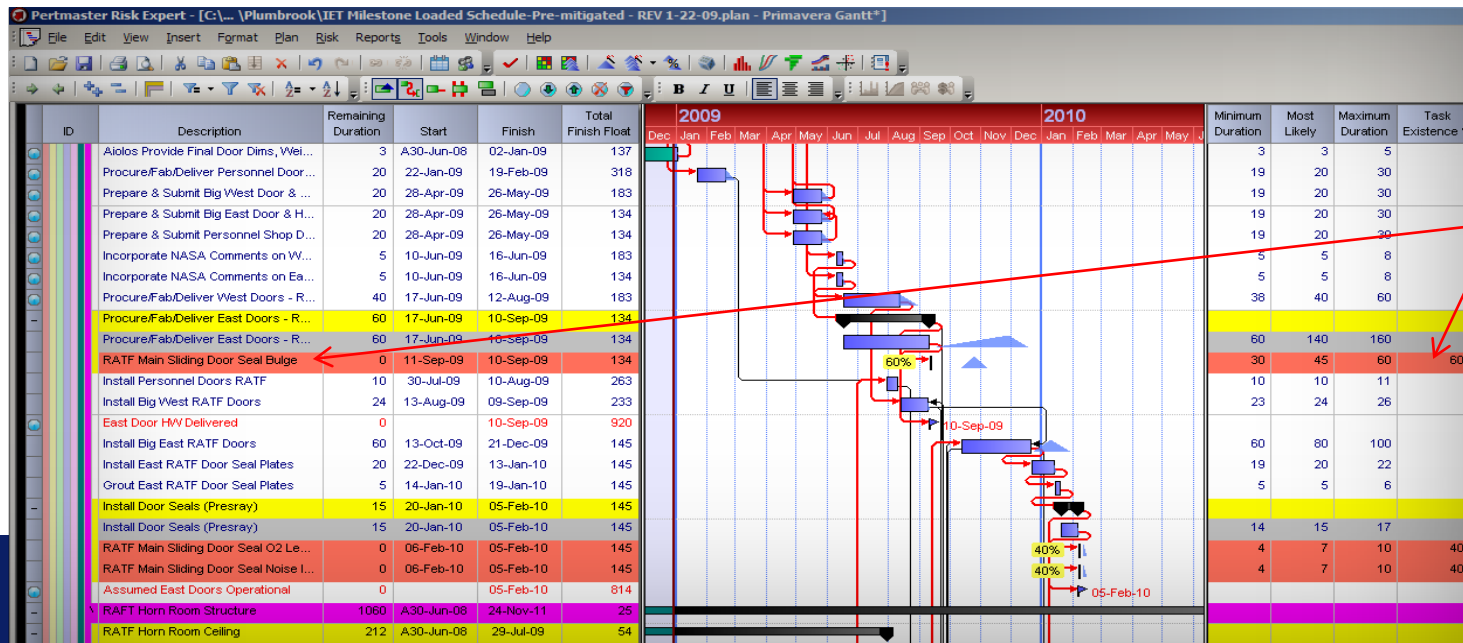

Overall Impact: VH

Start Date: 30-Dec-08, End Date: 28-Dec-12

Quantified risk: Show in Quantitative:

Once schedule assessment is complete, risk and uncertainty can help account for unexpected work and potential threats

- ▶ Using historical data, we can model a sensitivity analysis
 - Identify which work areas expanded the most
 - Identify the frequency in which the client requests ad hoc work
 - Identify how milestone completion was impacted by ad hoc work
- ▶ The results of the analysis can help the team develop an uncertainty/risk impacted schedule
 - Provides a better confidence level in achieving milestones
 - Carries burdened schedule items that allow for slippage throughout project lifecycle

▶ Minimum, Most Likely, and Maximum Duration and Cost uncertainties are both loaded in the sensitivity model

▶ Risks are loaded into the schedule, and given a minimum, most likely, and maximum impact against a probability of existence

Next steps should be to validate a mitigation strategy for the schedule

- ▶ The risk register must be validated
 - Mitigation steps should be built into the schedule
 - Cost for mitigation must be considered
- ▶ Opportunities must be captured in the schedule

The screenshot shows the 'Risk Register' application. On the left, a table lists risks with columns for ID, T/O, Title, Quantified, Probability, and Impacted Task ID(s). On the right, a project hierarchy tree is visible, showing tasks like '000001 - Enhanced Use Lease (EUL) Schedule Template' and '000002 - Phase I - Project Definition'.

| ID | T/O | Title | Quantified | Probability | Impacted Task ID(s) |
|-----|-----|--|--------------------------|-------------|----------------------|
| 001 | T | Phase 0 Delay | <input type="checkbox"/> | 85% | 000003 |
| 002 | T | Phase 1 Environmental Work | <input type="checkbox"/> | 60% | 000005 |
| 003 | T | Client environmental review delay | <input type="checkbox"/> | 85% | 000013 |
| 004 | T | Client feasibility review delay | <input type="checkbox"/> | 85% | 000021 |
| 005 | T | Flawed Analysis for Feasibility Study | <input type="checkbox"/> | 85% | 000018 |
| 006 | T | Improper Briefing at MAJCOM Installation Level | <input type="checkbox"/> | 60% | 000101 |
| 007 | T | Key Stakeholder Misinformation | <input type="checkbox"/> | 40% | 000088 |
| 008 | O | Source Selection Removal of Orals/ENs | <input type="checkbox"/> | 40% | 000060 |
| 009 | O | EA in lieu of EIS During NEPA | <input type="checkbox"/> | 40% | 000007 |
| 010 | O | Removal of one Congressional Approval Step | <input type="checkbox"/> | 5% | 000119 |
| 011 | F | EBS Baseline Control | <input type="checkbox"/> | 40% | 000004 |
| 012 | T | Congressional Delay | <input type="checkbox"/> | 40% | 000109,000044 |
| 013 | T | Lack of response to RFQ | <input type="checkbox"/> | 20% | |
| 014 | T | Non-Feasibility of EUL | <input type="checkbox"/> | 20% | |
| 015 | T | Negotiation Baseline Control | <input type="checkbox"/> | 20% | 000109,000088,000084 |
| 016 | T | EIS in lieu of an EA During NEPA | <input type="checkbox"/> | 20% | 000114,000109 |
| 017 | T | Permitting Challenges | <input type="checkbox"/> | 40% | |

The screenshot shows a project schedule Gantt chart. The chart displays tasks as horizontal bars with start and finish dates. A red arrow points from the 'Removal of one Congressional Approval Step' risk in the Risk Register to the 'National Environmental Policy Act (NEPA)' task in the Gantt chart. The Gantt chart also shows a timeline for 2012 and 2013 with monthly markers.

| ID | Description | Remaining Duration | Start | Finish | Total | Minimum Duration | Most Likely | Maximum Duration |
|--------|---|--------------------|-----------|-----------|-------|------------------|-------------|------------------|
| 000001 | Enhanced Use Lease (EUL) Schedule Template - 21 Jul 10 | 354 | 01-Apr-11 | 08-Aug-12 | 0 | | | |
| 000002 | Phase I Project Definition | 168 | 01-Apr-11 | 22-Nov-11 | 3 | | | |
| 000003 | Project Charter Completed | 0 | 01-Apr-11 | | 3 | | | |

- Analyzing Schedule Health
- Technical Deep Dive

- ▶ Conclusion

Schedule assessment helps determine other issues in the project

- ▶ A poor schedule could be a result of a systemic issue in the project or organization, and could include lack of data, lack of management support, poor communication, or poor process
- ▶ Through the course of client interviews, it is imperative to learn their scheduling process
 - How often is the schedule updated
 - Who provides input
 - Which scheduling tools are used, and are they used efficiently
 - Does the schedule produce valuable data to management
 - Is the schedule used as a planning tool
 - Has the schedule been vetted with project SME's
- ▶ Once these statements are true, or to some degree, acceptable – the schedule can be trusted to produce effective metrics and reports
