

Costs of Achieving Software Technology Readiness

Arlene Minkiewicz Chief Scientist 17000 Commerce Parkway Mt. Laure, NJ 08054 arlene.minkiewicz@pricesystems.com 856-608-7222

- Introduction
- Technology Readiness Levels (TRLs) and Technology Readiness Assessments (TRAs)
- Software TRL
- Software TRL Challenges
- Software TRL Costs
- Conclusions

- Complex systems require technology innovations to achieve sophisticated missions
- TRLs are used by NASA and DoD to assess the maturity of evolving technologies prior to using it in a system or subsystem
- Technology needs to reach a specified level of maturity before development on systems can begin
- The cost community needs to understand the cost impact associated with maturing technology required to meet program or mission requirements

- The definition and applications is very focused on hardware
- Software is different
 - Not as obvious what software technology means
- Software brings infinite possibilities for advancement of state of the art but these possibilities require the right mix of
 - Hardware
 - Tools
 - People
 - Processes
- Identifying the critical elements of software technology can be problematic

Presented at the 2010 ISPA/SCEA Joint Annual Conference and Training Workshop - www.iceaaonline.com **Technology Readiness Levels**

- Technology readiness is hard for most of us to grasp
 - Our experiences with technology are with fully matured technology
- In 1960's President Kennedy challenged the US to land on the moon in that century
- At the time there were no solutions to solve problems such as
 - Reaching earth orbit
 - Travel to the moon
 - Survival in space

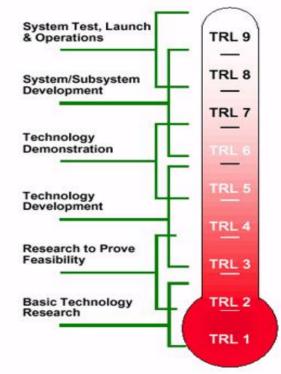

New technology needed to be invented!

Technology Readiness Levels

- NASA developed, institutionalized, service adopted similar levels
- TRLs generalized
 - 1. An idea
 - 2. Idea good and useful
 - 3. Idea is possible
 - 4. Idea presents realistic solution
 - 5. Alpha
 - 6. Beta
 - 7. Release candidate quality
 - 8. Gold release
 - 9. Used successfully in target environment

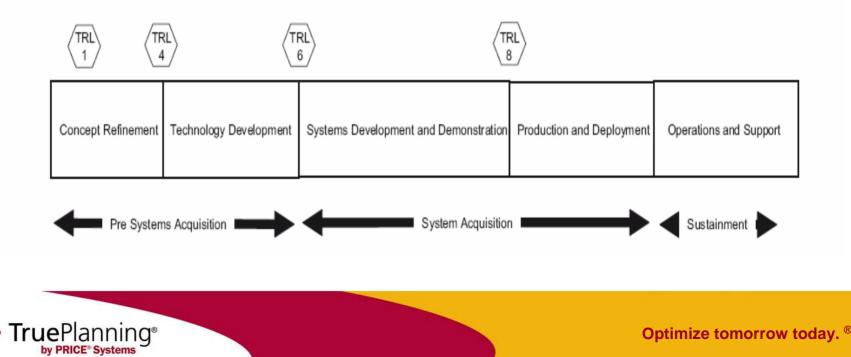

Presented at the 2010 ISPA/SCEA Joint Annual Conference and Training Workshop - www.iceaaonline.com **Technology Readiness Assessments**

- Document prior to system design and development that the acquisition is technically feasible
- DoD requires for Acquisition Category 1 (ACAT1) programs at Milestones A and B

Presented at the 2010 ISPA/SCEA Joint Annual Conference and Training Workshop - www.iceaaonline.com **Technology Readiness Assessment**

Identification of Critical Technology Elements (CTEs)

- New or novel technology
- Technology to operate in environment different from any previous
- Recommended that CTEs line up with Work Breakdown Structure (WBS)
- Each CTE is evaluated for technology readiness and assigned a TRL
- Maturation plans are developed for immature CTEs

Software TRL

- According to Robert Gold, there are five distinct ways software can be evaluated for technology readiness
 - Unprecedented functionality are the algorithms being implemented new or novel
 - Off the shelf (OTS) components has OTS capability been proven in intended environment
 - Enabling run time what besides the software itself (hardware, operating system functionality, middleware) is new, novel or unproven
 - Aggregation of components are components that are not critical on their own gain criticality if their interactions prevent critical components to succeed
 - Enabling development is the success of a component dependent on immature technology for implementation

Software TRL Challenges

- TRLs as initially developed are hardware focused
- The Army has developed software TRL definitions but there are still areas of potential confusion
- Software components are considered CTEs if the algorithms they deliver are new and novel, but there are also other things to consider...
 - Off the shelf software
 - Aging software
 - Supporting hardware and software

Presented at the 2010 ISPA/SCEA Joint Annual Conference and Training Workshop - www.iceaaonline.com Off the shelf capability

- IT applications are composed mostly of off the shelf applications
- Off the shelf components are assumed to be mature by their very nature – they are used in the field
- There are maturity issues that will make the OTS capability a CTE candidate
 - Technology not proven in intended operating environment
 - Interoperability of multiple OTS capabilities
- Additionally COTS products generally undergo a new release every 8 to 9 months with support for 3 latest releases. Does TRL persist once established

Aging Software

- Software never stops changing, when its off the shelf software this fact is exacerbated
- According to J. D. Smith, COTS products generally...

- Undergo new release every 8 to 9 months
- Have active vendor support for 3 releases
- Interfaces and interoperability issues may occur with new release
- COTS vendors sometimes retire solutions with new and improved alternative, sometime no alternative at all

Supporting hardware and software

Software does not stand alone

- Requires hardware to execute
- Requires software for support (Operating system, Databases, etc)
- Software itself may not be a CTE but consideration needs to be given to
 - IT that supports the software
 - Interfaces with software systems that support the software
 - Legacy capability when backward compatibility is crucial

Software TRL Costs

- Even when some of the technology is immature, there needs to be a plan for the program
- Modeling techniques can be used to analyze costs of moving from a low TRL to the point where its ready for development
- Analysis is partitioned into 3 part
 - Costs for theoretical studies to prove a concept (TRL 1-4)
 - Costs for development of the technology (TRL 6-8)
 - Costs for development and production of the system incorporating new technology with existing technology

Product Breakdown Structure for Technology Maturity Progression

- Paper studies and laboratory experiments
- Limited set of activities need to be accomplished
 - Requirements analysis and high level design (1-2)
 - Some low level design and code development (3-4)
- Cost driver recommendations
 - Size reflects new technology only based on assessment of desired capability through analogous experience
 - New design high
 - Complexity high
 - Operating environment not important
 - External integration not important

From TRL 4 to 6

 Technology is developed and tested in lab and operational like environments

Additional activities

- Coding and unit test occurs
- Integration and test of new technology or COTS product with mature technologies and legacy capabilities
- If hardware or other IT represents CTEs for software, hw/sw integration should be included

Cost driver recommendations

- Size of new technology should be less new and more reused or modified
- Size of elements or OTS that are integration critical important
- New design for new technology reduced
- Operating environment is important
- External integration is important

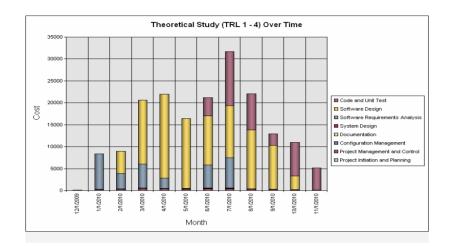

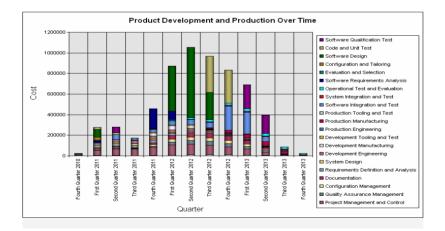

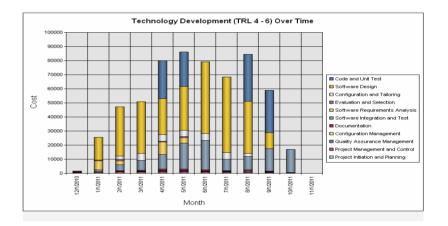

- More of a traditional estimate from this point on
- Cost driver recommendations
 - New technology should be modified or reused, not new
 - New design for new technology should be low
 - Integration complexities lower for integrations already tested
 - Take credit for experience of personnel if applicable

Costs and activity spread

Conclusions

- It is important that projects respect the risks associated with new technologies and use TRAs to mitigate these risks
- Software is increasingly called upon to deliver new technology presenting new CTE identification challenges beyond 'new and novel'
 - Off the shelf software
 - Aging software
 - Supporting hardware and software
- Once CTEs have been identified, parametric estimating techniques exist to estimate the costs of maturing and using new software technologies
