

Predicting Maintainability for Software Applications Early in the Life Cycle

Cara Cuiule
ICEAA 2018

Presented at the 2018 ICEAA Professional Development & Training Workshop - www.iceaaonline.com

Agenda

- Introduction
- Definitions, scope of research
- Maintainability measurement models
- Effort versus maintainability
- Metrics for maintainability at the start of the life cycle
- Recommendations for future research

```
var simple = type.Sibling;
forward = type.Sibling;
ofType = what === "of-type";

return first === 1 && last === 0 ?

// Shortcut for :nth-*(n)
function( elem ) {
    return !elem.parentNode;
} :

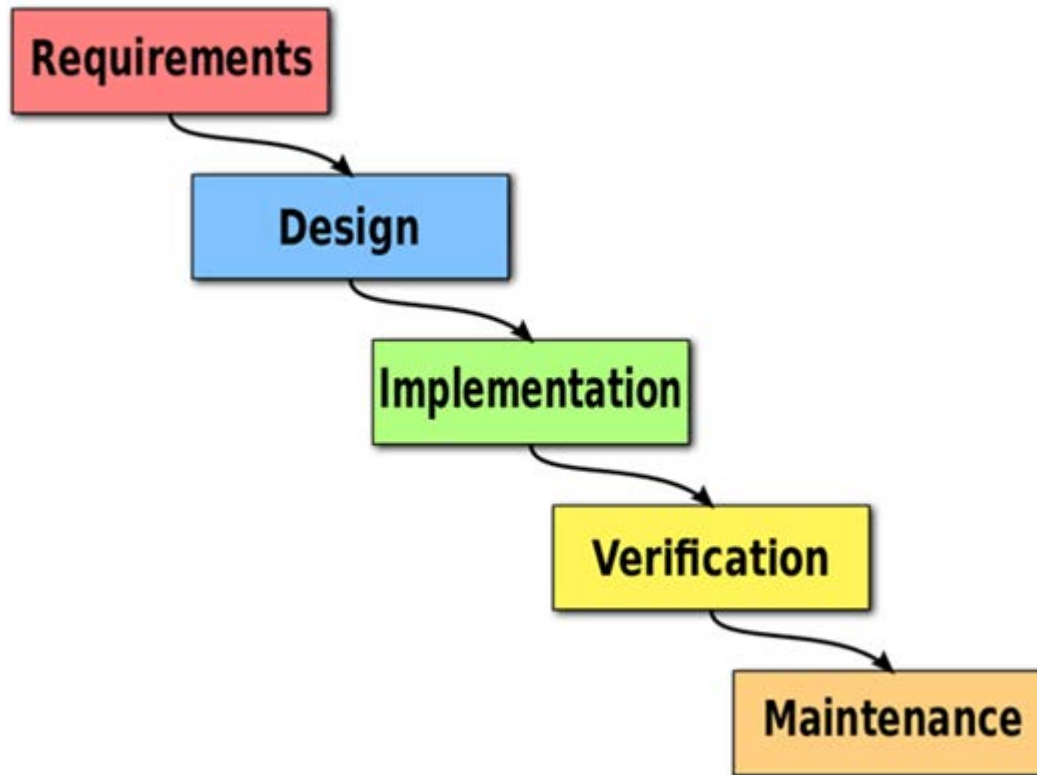

function( elem, context, xml ) {
    var cache, outerCache, node, diff, nodeName, start,
        dir = simple !== forward ? "nextSibling" :
            "previousSibling",
        parent = elem.parentNode,
        name = ofType && elem.nodeName.toLowerCase(),
        useCache = !xml && !ofType;

    if ( parent ) {
        if ( ofType ) {
            nodeName = ofType.toLowerCase();
            if ( name === nodeName ) {
                if ( diff = 0 ) {
                    while ( elem = dir.call( parent, elem ) ) {
                        if ( ofType === "type" ) {
                            if ( elem.nodeType === 1 && elem.nodeName.toLowerCase() === ofType.toLowerCase() ) {
                                return true;
                            }
                        } else {
                            if ( elem.nodeType === 1 ) {
                                return true;
                            }
                        }
                    }
                } else {
                    while ( elem = dir.call( parent, elem ) ) {
                        if ( ofType === "type" ) {
                            if ( elem.nodeType === 1 && elem.nodeName.toLowerCase() === ofType.toLowerCase() ) {
                                return true;
                            }
                        } else {
                            if ( elem.nodeType === 1 ) {
                                return true;
                            }
                        }
                    }
                }
            }
        } else {
            if ( diff < 0 ) {
                while ( elem = dir.call( parent, elem ) ) {
                    if ( elem.nodeType === 1 ) {
                        return true;
                    }
                }
            } else {
                while ( elem = dir.call( parent, elem ) ) {
                    if ( ofType === "type" ) {
                        if ( elem.nodeType === 1 && elem.nodeName.toLowerCase() === ofType.toLowerCase() ) {
                            return true;
                        }
                    } else {
                        if ( elem.nodeType === 1 ) {
                            return true;
                        }
                    }
                }
            }
        }
    }
}
```

- **Maintainability** – how easy it is to change a system
 - Sub-Characteristics
 - *Modularity*
 - *Reusability*
 - *Analyzability*
 - *Modifiability*
 - *Testability*
 - Internal vs. External Attribute

- **Maintenance** – changes made to a system after initial release
 - Corrective
 - Adaptive
 - Perfective
 - Preventive

Find maintainability models that could be measured in Requirements phase of life cycle

- No standard parametric model
 - Especially not for estimating near the beginning of the lifecycle

- Models researched used combination of the following:
 - Source Code Metrics
 - Design Metrics
 - Expert opinion

Maintainability Models that use one or more of the following:

- **Source code metrics**
 - Maintainability Index (Oman and Hagemeister)

- **Design metrics**
 - Software Maintainability Index (Muthanna et al.)

- **Expert opinion**
 - Software Improvement Group (SIG) Model

■ Maintainability Index

– Oman and Hagemester

$$= 171 - 5.2 * \ln(\text{aveV}) - 0.23 * \text{aveV}(g') - 16.2 * \ln(\text{aveLOC}) + 50.0 * \sin\sqrt{2.46 * \text{aveCM}}$$

– Inputs are average for each module:

- *aveV = Halstead Vol*
- *aveV(g') = McCabe's Cyclomatic Complexity*
- *aveLOC = Lines of Code*
- *aveCM = % of lines of comments*

– Average maintainability between 65 and 85

Software Maintainability Index

- Developed by Muthanna et al.
- Design phase metrics
- Formula for each module:

$$SMI = 125 - 3.989 * FAN - 0.954 * DF - 1.123 * MC$$

- *SMI = Software Maintainability Index (0-125)*
- *FAN = Average number of external calls*
- *DF = Data flow*
- *MC = Average McCabe Cyclomatic complexity*

- SIG Model
 - Developed due to criticism about MI model
 - Gives each sub characteristic of maintainability a score

		source code properties				
		volume	complexity per unit	duplication	unit size	unit testing
ISO 9126 maintainability	analysability	x		x	x	x
	changeability		x	x		
	stability					x
	testability		x		x	x

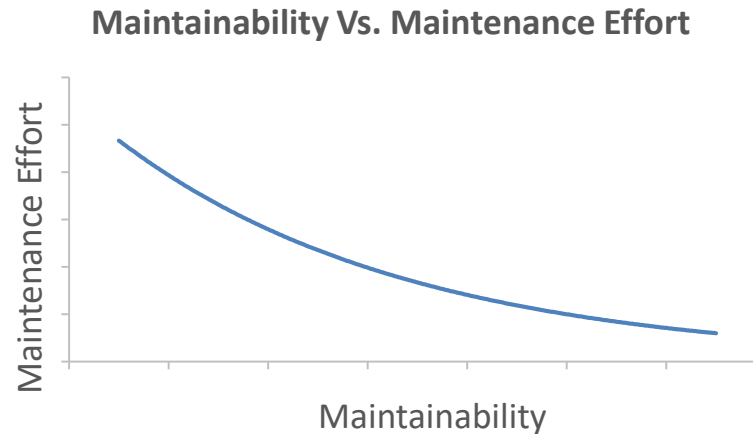

- Earliest we can use models is design phase

Goals

- Determine relationship between maintenance effort and maintainability
- Find other metrics that could be measured or estimated before implementation phase

■ Theory

- Maintainability and effort have a negative relationship

■ Practice

- Experts assume the same relationship to measure maintainability
 - *Riaz et al., Hayes et al., Sjøberg et al.*
- Studies actually tried to measure relationship
 - *Maintainability Prediction Model (MainPredMo)*
 - *SIG Model Validation*

- Maintainability Prediction Model (MainPredMo)

- $RDCRatio = \frac{Reqd\ Effort + Design\ Effort}{Coding\ Effort}$

- $Maintainability = 3.795 + 1.652 * RDCRatio$

- SIG Model

- Higher maintainability, less time for corrective maintenance and enhancements (perfective maintenance)

- For now, assume maintainability and effort have a negative relationship

Promising Metrics for the Beginning of the Life Cycle

1. Size related
2. Use of Object Oriented Language
3. Good Coding practices
4. Use of Organizational Guidelines

- Size related metrics can be estimated very early in life cycle
 - SLOC, LOC, LLOC, Function Points, etc.

- Studies looked at LOC

- Various claims it has relationship with maintainability
 - Sjøberg et al., Heitlager et al., Nishizono et al., Riaz et al.

- Some works claim weak relationship
 - Hayes and Zhao, Hegedűs et al. (“Source Code Metrics”)

- Object oriented language leads to system with better maintainability
 - Lim et al.
 - Dash et al.

- Unclear if this is dependent on the use of good design practices such as UML

- Recommendations made by Hayes et al.
 - Good coding/architecture practices
 - Clear rules/standards
 - Focus work on important parts of system

- What are “good” coding standards?
 - No clear answer

- **Capability Maturity Model Integration (CMMI)**
 - Use in the development phase
 - Study shows it improves quality and productivity
 - *Not strictly software related data*

- **Software Maintenance Maturity Model**
 - Developed by April and Abran
 - Claims of improvement not yet backed by research

- **First develop a standard maintainability metric**

- **Verify relationship between maintainability & maintenance effort**

- **Determine how the following factors influence maintainability**
 - Size
 - Object Oriented language tied with design practices
 - Coding practices
 - Organizational processes

- **Realistic route: keep looking into design based metrics**

Conclusion

- Studies use different ways to measure maintainability
- More research needs to be done

Questions?

Cara Cuiule

cara.cuiule@pricesystems.com

CMMI Study

- Improved quality by 50% and productivity by 60%
- Issues
 - Not all organizations were software
 - No standard way to measure quality and productivity
 - *Ex – lines of code written versus number of units produced*

Software Maintenance Maturity Model (SMmm)

- Meant to be supplemental to CMMI
- Vetted by academia and industry professionals
- No research claiming effect on productivity and organizational processes
